EXECUTIVE SUMMARY

The following report is a Multimodal Transportation Analysis (MMTA) for the New Elementary School (ES) at the Reed site. The New ES at Reed project consists of creating a new neighborhood elementary school, with a capacity of 732 students, to be opened for the start of the 2021-2022 school year. The Reed site was selected for a new neighborhood school in the APS Strategic Plan. The project is currently in the schematic design phase. This MMTA is based on the conceptual plans for the New ES.

The purpose of this report is to review existing and future transportation facilities in the area surrounding the project site, project transportation demand needs of the project, determine if the new transportation demand generated by the project would have detrimental impacts on the surrounding transportation network, and present recommendations to minimize the detrimental impact from the proposed project.

This report concludes that the New ES at the Reed site will not have a detrimental impact to the surrounding transportation and roadway network given the recommendations from this report are implemented, including the Transportation Management Plan.

Study Area and Project Description

The site is surrounded by an extensive regional and local transportation system that will connect students, staff, and visitors of the project to the rest of Arlington County and surrounding areas. Several local initiatives will positively impact the study area, including the Washington Boulevard Bike, Pedestrian, and Roadway Enhancements, and a number of Neighborhood Conservation projects.

The current Reed site is home to:

- The Westover Library, a local branch of the Arlington Public Library
- The Children's School, a non-profit daycare and pre-school focused on serving APS staff
- Integration Station, APS' preschool for special education students
- A recreational area with several athletic fields

The conceptual plan to add an elementary school for the site demolishes the building currently housing The Children's

School and Integration Station. The Westover library will remain, and the athletic fields will be reconfigured but remain on the site.

Transportation Demand

Based on extensive surveys of APS students and staff, observations of the Reed site and other APS facilities, and traffic and parking data collected near the Reed site, this report assembled detailed projections of travel demand assumptions for the New ES.

The following mode splits are anticipated for the New ES:

- Students:
 - 38% Automobile
 - 36% School Bus
 - 26% Walk/Bike
- Staff:
 - 89% Automobile
 - 9% Walk/Bike
 - 2% Transit

The conceptual design was based on projected transportation demands, which are detailed in the report. The site was designed to accommodate:

- Parking demand of 45 spaces for the library, and 119 spaces for the New ES
- Queuing room for 30 cars at the student drop-off and pick-up area
- Space for 7 school buses to load and unload students

The conceptual design for the project includes 125 parking spaces in expanded Northwest and 18th Street lots, and approximately 10 spaces that can be used for visitor parking in the pick-up/drop-off area. After schematic design, this number may change slightly. Based on the expected supply, some of the parking demand is accommodated on-street in order to preserve green space on site.

Traffic Operations

This MMTA contains a detailed analysis of capacity at nearby intersections. The assumptions and methodologies of the capacity analyses were scoped with Arlington County DES staff. The analyses include a comparison of traffic capacity for existing conditions, and projected future conditions including scenarios with and without the project.

The analysis reached the conclusion that the surrounding streets can accommodate the anticipated traffic from the New ES, given certain design elements were incorporated into the schematic design and a Transportation Management Plan (TMP) is developed and implemented. This conclusion was based on the following findings from the technical analysis:

- The existing study area intersections all operate at acceptable levels of service and delay, with one exception. The southbound approach of 18th Street N to Washington Boulevard shows long delays as side street traffic waits for gaps in Washington Boulevard traffic. This condition is common for side streets with low traffic volume intersecting an arterial like Washington Boulevard.
- The future scenarios show similar results, with all study area intersections operating at acceptable levels with one exception.
- The vehicular trip generation from the New ES is relatively minor and does not change traffic patterns nearby in a detrimental way. This is especially true for during PM commuter park hour. The AM peak hour trip generation of 379 vehicles/hour is the equivalent of one new car on the road every 9.5 seconds. During the PM school peak hour, the vehicular trip generation of 310 vehicles/hour is the equivalent of one new car on the road every 11.5 seconds. During the PM commuter peak hour, the vehicular trip generation of 25 vehicles/hour is the equivalent of one new car on the road every 144 seconds.
- This report does not recommend any traffic mitigation measures for the proposed New ES (e.g. roadway widening or new traffic signals).
- A sensitivity analysis that explored different mode split scenarios for the New ES confirmed the findings of the baseline mode split scenario.
- These findings are based on trip generation and routing assumptions that are reliant on the certain elements being included in the New school's Transportation Management Plan (TMP). Thus, this report recommended development and implementation of the TMP be a commitment of approval.

Parking Impacts

This MMTA reviewed the projected parking demand and opportunities for parking supply to determine potential impacts the project could have on the surrounding neighborhood. Detailed counts of parking occupancy on surrounding streets and nearby off-street parking lots were performed to gain an understanding of parking opportunities and concerns. After reviewing the data collected, this report found the following:

- The New ES and associated parking lots should maximize the ability to share parking between the New ES and the library in a manner that helps prevent library visitor parking from using other parking supplies.
- Residential parking on surrounding streets in the neighborhood is readily available during the school day. The streets directly adjacent to the school could serve as a potential resource of parking supply for New ES staff and visitors.
- On weekdays, the retail areas adjacent to the Reed site have the highest parking demand mid-day, which coincides with school peak parking demand. Thus, there is a potential for the New ES parking demand to impact retail parking supply. Additionally, there is an opportunity for retail parking demand to use school parking supply outside of school hours.

Based on the overlap of parking demands with New ES, and in order to most efficiently use the parking provided on the Reed site while saving space for recreation fields, this report presents the following parking recommendations:

- Take advantage of the parking availability on surrounding neighborhood streets by using it as part of the parking supply for New ES staff.
- Based on a review of parking demand on residential streets adjacent to the Reed site, this report recommends that a maximum of 30 parked vehicles generated by the New ES should be parked off-site. Based on the parking demand calculations for the uses on site, this results in a minimum recommended parking supply on-site of 124 spaces. This report recommends that be the required minimum parking on site in lieu of the 150 spaces required by Zoning.

- Discourage New ES (and library) staff from parking in front of retail areas or the library, so that those spaces can be used by retail patrons and library visitors. Work with County staff on curbside management changes to on-street parking areas to deter staff parking in certain locations.
- Utilize the New ES's area set aside for arrival drop-off and dismissal pick-up queuing for visitor parking at other times. This additional visitor parking could be used by the library, notably to boost the supply during events such as story time that do not coincide with school arrival or dismissal.
- Sign the expanded Northwest and 18th Street parking lots in a manner that encourages sharing outside of school operating hours. Use signs such as "APS and Library Staff parking only, Mon-Fri 6:00 AM to 4:30 PM, Public parking all other times".

Pedestrian Facilities

The report contains a review of pedestrian walking routes to and from the Reed site to help develop a set of recommendations improvements to raise the potential walking mode split of students and staff at the New ES. The steps performed in this review included:

- A detailed review of infrastructure within a 0.25-mile distance of the site
- A detailed review of additional walking routes beyond 0.25 miles, based on potential walk zone boundaries for the New ES
- A review of crossing quality along walking routes across arterial roadways
- An examination of impacts that planned County projects would have on walking route quality

The following conclusions are reached regarding pedestrian facilities:

- Walking routes adjacent to the school generally meet County standards, with some exceptions
- Some targeted sidewalk improvements could help improve walking route quality, within the study area sidewalks can primarily be improved by adding sidewalks along expected walking routes that only have a sidewalk on one side of the street
- The presence of multiple signalized intersections along Washington Boulevard in the vicinity of the site

provide safe crossing locations for pedestrians across an arterial.

- Already planned infrastructure enhancements by the County on Washington Boulevard and Patrick Henry Drive will significantly improve pedestrian access to the site, especially at the intersection of Patrick Henry Drive and 16th Street N
- This report recommends that the placement of crossing guards be considered at the following intersections when the school opens:
 - Washington Boulevard and 18th Street N
 - Patrick Henry Drive and 18th Street N
 - Patrick Henry Drive and 16th Street N
 - N Lexington Street and 18th Street N

Bicycle Facilities

Based on a review of bicycle facilities, this report concludes the following:

- The site has good connectivity to existing on- and off-street bicycle facilities. The site is surrounded by local neighborhood streets, bicycle lanes on Washington Boulevard and Patrick Henry Drive, and the W&OD and Custis Trails.
- While there are no bicycle lanes on Washington Boulevard adjacent to the site and stretching westward, planned improvements will add bicycle lanes and narrow vehicular lanes in both direction, improving bicycle comfort levels.
- There is one (1) Capital Bikeshare station adjacent to the site, with an additional station planned to be installed at the intersection of Washington Boulevard and Patrick Henry Drive in FY2018.
- The plans for on-site bicycle parking for the New ES are currently being developed as part of the schematic design. The school will meet or exceed County requirements for short and long-term bicycle parking on site and provide showers and lockers for staff that commute via bicycle.
- This report recommends short-term bicycle parking be located on both the southern and northern entrances to the New ES, as cyclists will likely approach the school from several directions.

Transportation Management Plan

A Transportation Management Plan (TMP) has many components that are tailored to accommodate a given facility

with the goal being the reduction of automobile trips by encouraging alternative forms of transportation and ensuring safe and efficient operations of transportation facilities.

This report outlines some of the potential TMP components for the New ES, including:

- A Transportation Demand Management (TDM) plan;
- A Safe Routes to School plan;
- A Parking Management Plan;
- Arrival and Dismissal Plans; and
- A Performance and Monitoring Plan.

Conclusion

This MMTA reached the conclusion that the development of the New ES on the Reed site will not have a detrimental impact to the surrounding roadway or parking systems, given certain design elements were incorporated into the schematic design and a Transportation Management Plan (TMP) is developed and implemented.

The required elements needed to be incorporated in schematic design include:

- A minimum of 124 off-street parking spaces on-site
- Room of seven school buses to load/unload
- An off-street student drop-off/pick-up area that can accommodate 30 total cars in queue
- Adequate bicycle parking for staff and students, with student parking located on multiple sides of the building

INTRODUCTION

This report is a Multimodal Transportation Analysis (MMTA) for the New Elementary School (ES) at the Reed site. The New ES at Reed project consists of creating a new neighborhood elementary school, with a capacity of 732 students, to be opened in for the start of the 2021-2022 school year. The Reed site was selected for a new neighborhood school in the APS Strategic Plan. The project is currently in the schematic design phase. This MMTA is based on the conceptual plans for the New ES. Figure 1 shows the location of the Reed site.

PURPOSE OF STUDY

The purpose of this report is to:

1. Review existing and future transportation facilities in the area surrounding the project site.
2. Project the transportation demand needs of the proposed project.
3. Determine if the new transportation demand generated by the project would have detrimental impacts on the surrounding transportation network
4. Present recommendations to minimize the detrimental impact from the proposed project, including providing recommendations for the design team to incorporate into the schematic design

STUDY TASKS

The following tasks were completed as part of this study:

- A scoping meeting was held with Arlington County Department of Environmental Services (DES) staff on January 3, 2018. This meeting reviewed assumptions and methodologies for this MMTA.
- A scoping form based on the meeting with County staff was submitted to the County and subsequently approved.
- Field reconnaissance was performed at the Reed site to review lane configurations and traffic controls, as well as at other APS elementary schools to review pick-up/drop-off procedures and queues.
- Traffic counts were conducted at 11 locations on Thursday, February 1, 2018.

- APS Go! data for comparable APS facilities was reviewed to help establish mode split assumptions.
- Parking counts (inventory and occupancy) were conducted in the area surrounding the Reed site on Tuesday December 12, 2017, and Thursday, April 12, 2018.
- Capacity analyses for the existing conditions were performed.
- A revised scoping form submitted to the County and subsequently approved. The revised scoping form updated some of the assumptions to be used in this MMTA based on the processed APS Go! data and the existing conditions capacity analysis results.
- Future capacity analyses were performed based on the revised scope.
- Multimodal analyses were performed reviewing pedestrian and bicycle travel to and from the project.
- The analysis findings and recommendations were documented in this report.

CONTENTS OF STUDY

This report contains nine sections as follows:

- Study Area Overview
This section reviews the area near and adjacent to the proposed project and includes an overview of the site location, and local initiatives within the study area.
- Project Design
This section reviews the transportation components of the project, including the site plan and access. Included is a review of parking, truck access, and loading/unloading facilities.
- Travel Demand Assumptions
This section outlines the travel demand of the proposed project. It contains projections on the mode splits of site users and summarizes the proposed trip generation of the project.
- Traffic Operations
This section provides a summary of the existing roadway facilities and an analysis of the existing and future roadway capacity in the study area. This section highlights the vehicular impacts of the project, including presenting mitigation measures for minimizing impacts as needed.

- Parking
This section reviews the available parking surrounding the Reed site and presents parking recommendations.
- Pedestrian Facilities
This section summarizes existing and future pedestrian access to the site, reviews walking routes to and from the project site, outlines impacts, and presents recommendations as needed.
- Bicycle Facilities
This section summarizes existing and future bicycle access to the site, reviews the quality of cycling routes to and from the project site, outlines impacts, and presents recommendations as needed.
- Transportation Management Plan
This section outlines the various components of the project's Transportation Management Plan (TMP), including Transportation Demand Management (TDM) and Safe Routes to School (SRTS) plans.
- Summary and Conclusions
This section presents a summary of the recommended mitigation measures by mode and presents overall report findings and conclusions.

SECOND DRAFT

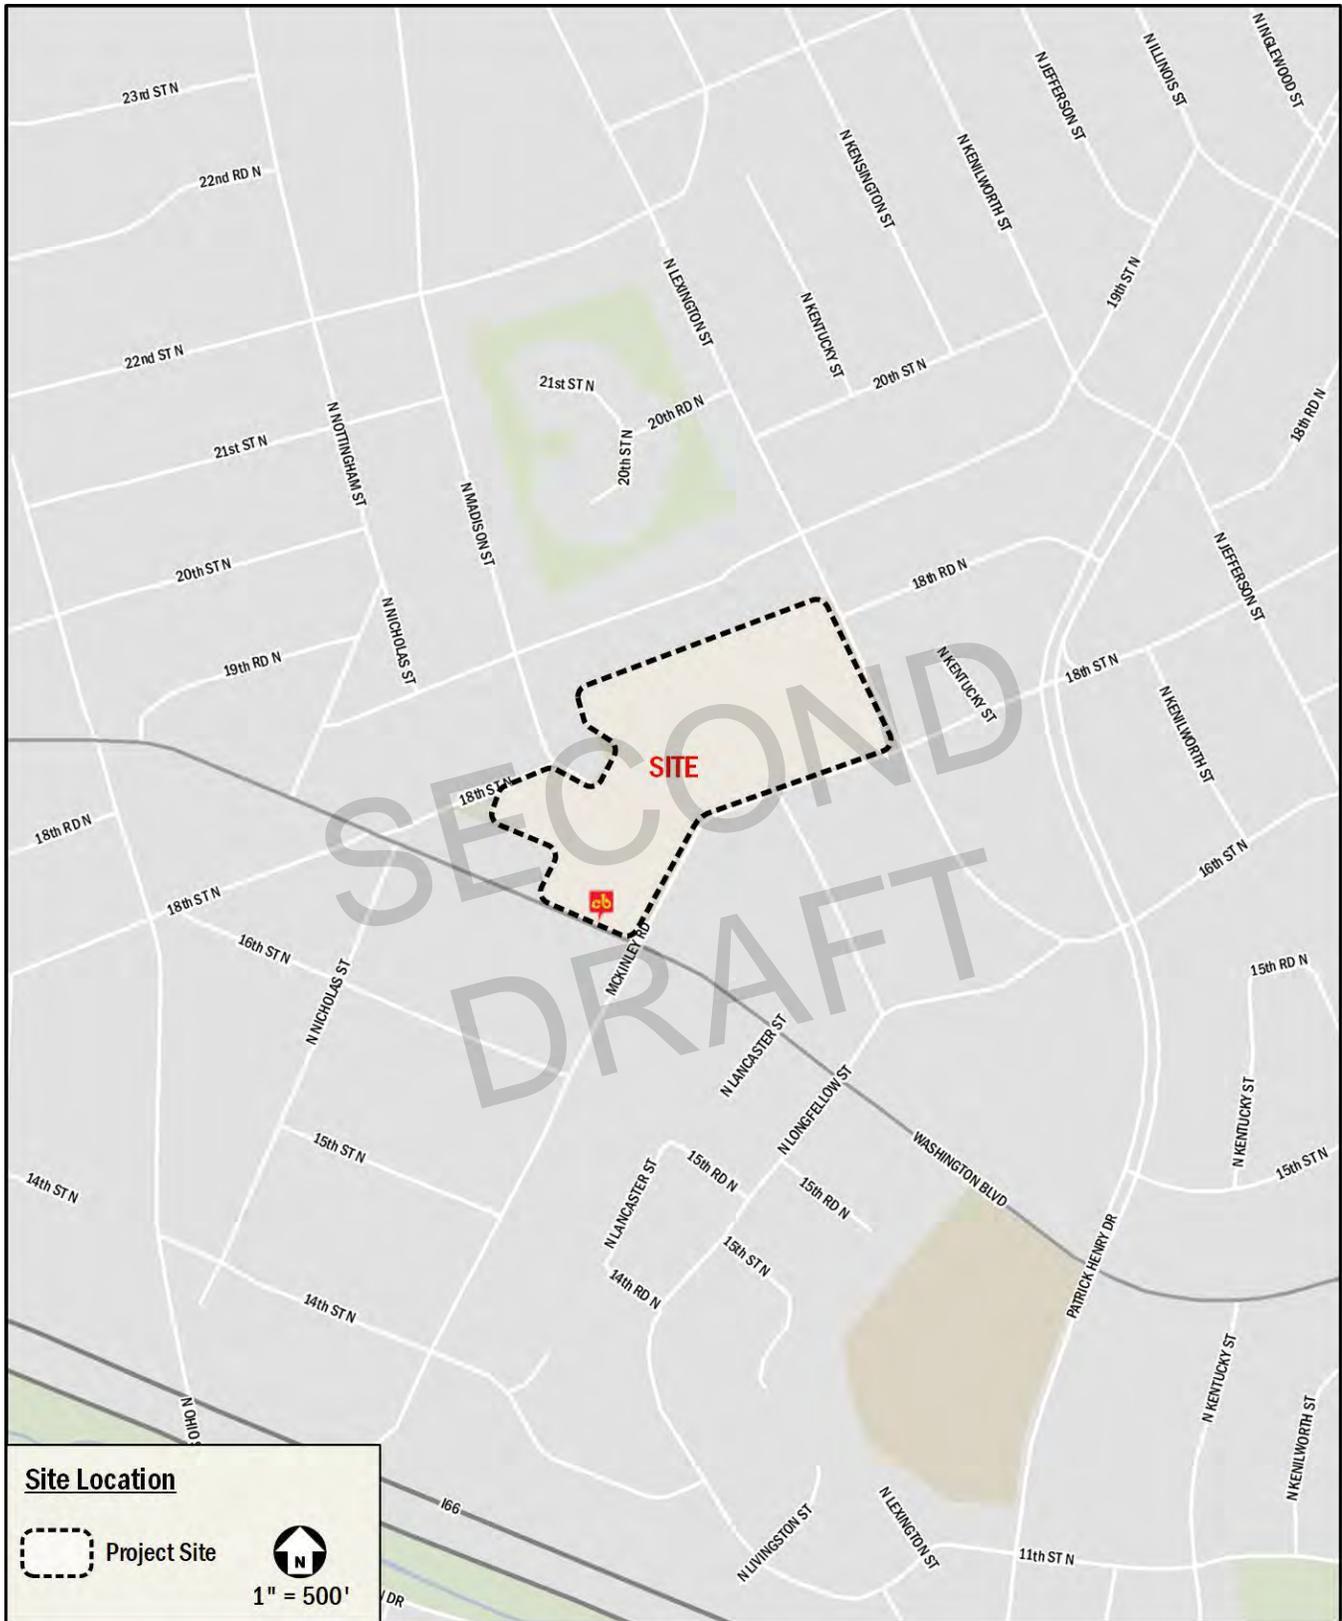

Figure 1: Site Location

STUDY AREA OVERVIEW

This section reviews the study area and includes an overview of the site location, including a summary of the major transportation characteristics of the area and of future regional projects.

The following conclusions are reached within this chapter:

- The site is surrounded by an extensive regional and local transportation system that will connect students, staff, and visitors of the project to the rest of Arlington County and surrounding areas.
- The site is served by public transportation with access to two Metrorail lines, and several local and regional bus routes.
- There is existing bicycle infrastructure including the W&OD and Custis Trails, and several bicycle lanes and signed routes in the vicinity of the site.
- Pedestrian conditions are generally good, particularly along anticipated major walking routes
- Several local initiatives will positively impact the study area, including the Washington Boulevard Bike, Pedestrian, and Roadway Enhancements, and a number of Neighborhood Conservation projects

MAJOR TRANSPORTATION FEATURES

Overview of Regional Access

Overview of major facilities, not a detailed description. Include highways, arterials, transit, major bicycle facilities. Cite mode specific chapters if they exist later in the report.

The New ES at Reed site has ample access to regional vehicular-, transit-, and bicycle-based transportation options, as shown in Figure 3, that connect the site to destination within Virginia, the District, and Maryland.

The site is accessible from interstate I-66, US Highways such as US-29 (Lee Highway) and US-50 (Arlington Boulevard), as well as State Routes such as SR-237 (Washington Boulevard), SR-694 (Great Falls Street), and SR-120 (N Glebe Road). All of these roadways bring vehicular traffic within a half-mile of the site, at which point arterials and local roads can be used to access the site directly. The main arterials in the vicinity of the site are Washington Boulevard and Patrick Henry Drive.

The site is located 0.8 miles from the East Falls Church Metrorail station, which is serviced by the Orange and Silver lines, and provide connection to areas in Virginia, the District, and Maryland that are near Metrorail. The site is also serviced by one major regional bus route which connects to multiple Metrorail stations in Arlington County and Falls Church.

The site is located a short distance from the W&OD and Custis Trails, which are both located less than 0.5 miles from the site. These two trails make up part of the “Arlington Loop”, which provides local and regional off-street connectivity for bicycles to and from the site. A detailed review of existing and bicycle access and infrastructure is provided in a later section of this report.

Overall, the site has access to several regional roadways, transit, and bicycle options, making it convenient to travel between the site and destinations in the Virginia, the District, and Maryland.

Overview of Local Access

Overview of major facilities, not a detailed description. Include collectors, local transit, bicycle facilities. Cite mode specific chapters if they exist later in the report.

There are several local transportation options near the site that serve vehicular, transit, walking, and cycling trips, as shown on Figure 3.

The site is served by a local vehicular network of low volume neighborhood streets that provide connections from regional roads to the site.

Arlington Transit (ART) is a local bus system provided by Arlington County. ART supplements Metrobus with cross-County routes as well as neighborhood connections to Metrorail. As shown in Figure 4 there are multiple bus routes that service the site. In the vicinity of the site, the majority of bus routes travel along Washington Boulevard.

There are existing bicycle facilities that connect the site to neighborhoods within Arlington County, most notably bicycle lanes on Patrick Henry Drive, Washington Boulevard, and N Ohio Street. Other facilities include bicycle-friendly roads that include signed routes on N Lexington Street, N McKinley Road, 16th Street N, and 22nd Street N.

As shown in Figure 2, the site is situated in a neighborhood that encompasses good walkscores and bikescores. The site is in an area that provides a better walking environment than areas to the west and south which either lack sidewalk coverage or have physical barriers limiting connectivity such as I-66. A detailed review of existing and proposed pedestrian access and infrastructure is provided in a later section of this report.

Car-sharing

Two car-sharing companies provide service in Arlington County: Zipcar and Car2Go. Both are private companies that provide registered users access to a variety of automobiles. Of these, Zipcar has designated spaces for their vehicles. There are no car-share locations within a quarter-mile of the site.

Car-sharing is also provided by Car2Go, which provides point-to-point car-sharing. Car2Go currently has a fleet of vehicles located throughout the District and Arlington. Car2Go vehicles may park in any non-restricted metered curbside parking space or Residential Permit Parking (RPP) location in any zone throughout the defined “Home Area”. Members do not have to pay the meters or pay stations. Car2Go does not have permanent designated spaces for their vehicles; however, availability is tracked through their website and mobile phone application, which provides an additional option for car-sharing patrons.

Walkscore

Walkscore.com is a website that provides scores and rankings for the walking, biking, and transit conditions within neighborhoods of Arlington County. Based on this website the planned development is located in the Highland Park – Overlee Knolls neighborhood. The site location has a walk score of 76 (or “Very Walkable”), a transit score of 51 (or “Good Transit”), and a bike score of 75 (or “Very Bikeable”). shows the neighborhood borders in relation to the site location and displays a heat map for walkability and bikeability.

The site is situated in an area with good walk scores because of the abundance of neighborhood serving retail locations that are in close proximity, where most errands can be completed by walking.

The transit score was based on the proximity to multiple bus lines, and distance to the nearest Metrorail stop which is located 0.8 miles from the site.

The site is situated in an area with good bike scores due to its proximity to low volume residential roadways, number of bike lanes and trails, and flat topography.

Overall, the Highland Park – Overlee Knolls neighborhood has high walk, transit, and bike scores. Additionally, planned roadway improvements will help increase the walk, bike, and transit scores in the Highland Park – Overlee Knolls neighborhood.

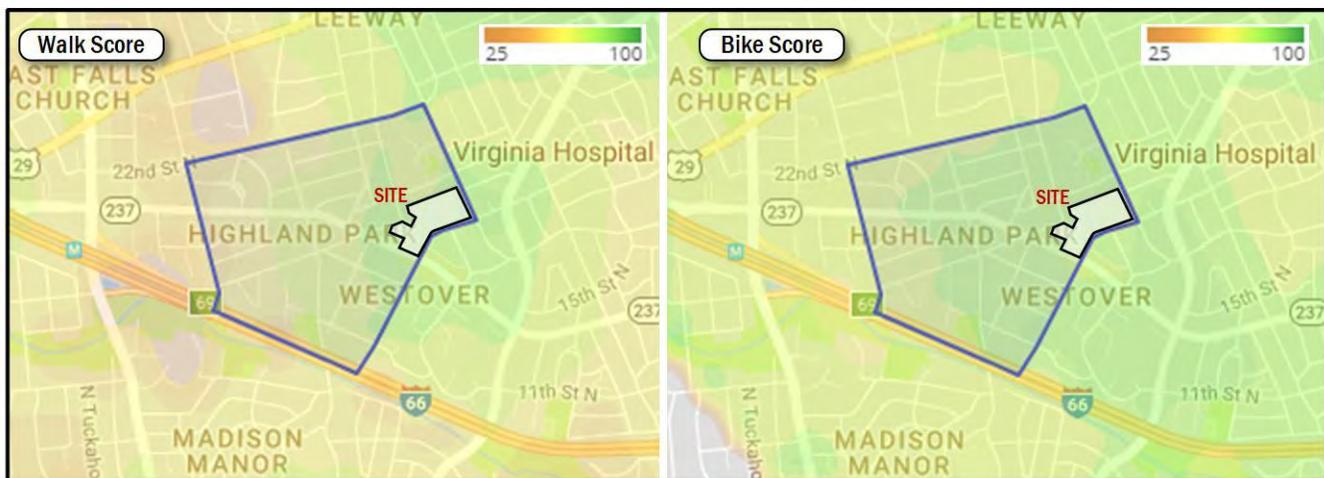

Figure 2: Walkscore and Bikescore

Figure 3: Major Regional Transportation Facilities

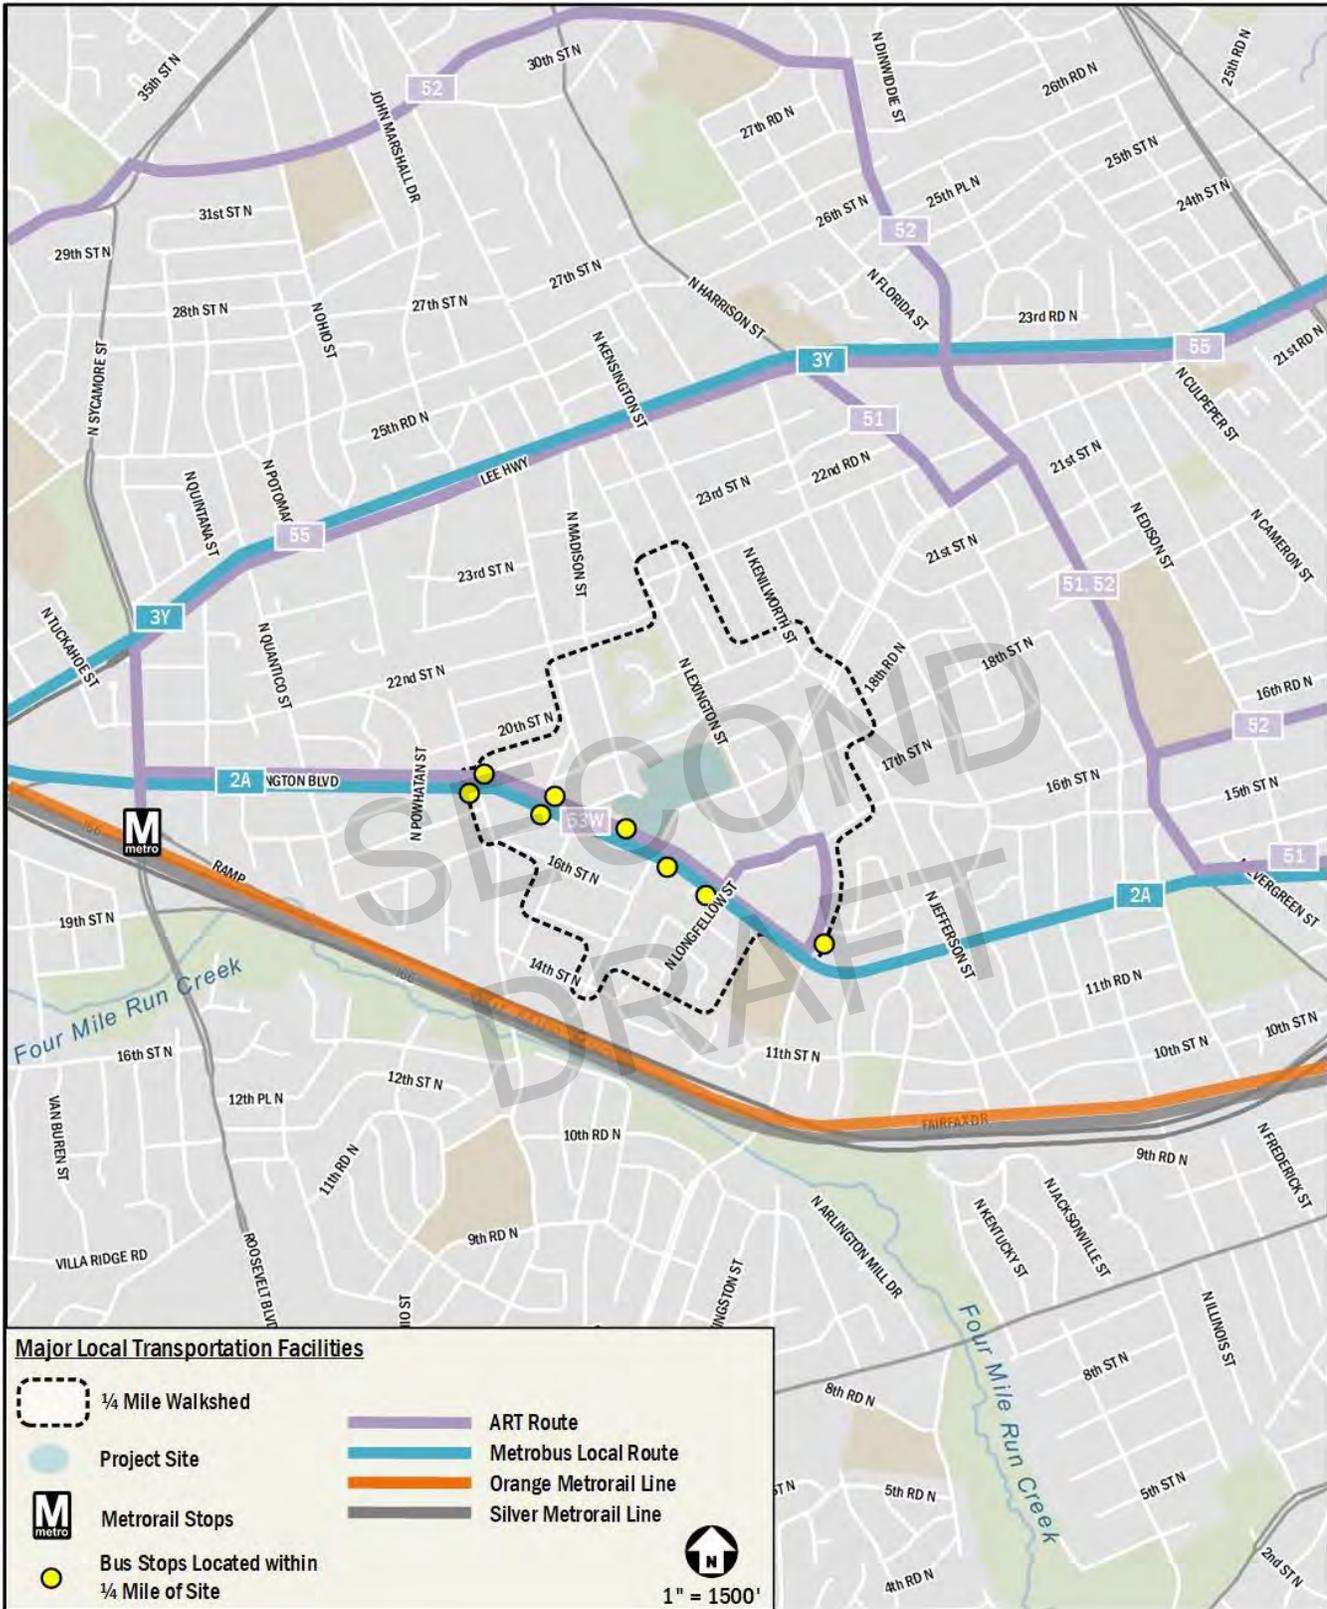

Figure 4: Major Local Transportation Facilities

FUTURE PROJECTS

There are a few local initiatives and approved developments in the vicinity of the site. These planned and proposed projects are summarized below.

Local Initiatives

Washington Boulevard Bike, Pedestrian, and Roadway Enhancements

The stretch of Washington Boulevard between Westover and East Falls Church is a VDOT owned and operated roadway. During the winter of 2016/2017, County staff developed a new striping and marking plan, with input from area property owners and community stakeholder groups, and VDOT will execute the work. Currently the road consists of two wide travel lanes and on-street parking through much of the corridor.

The most significant feature of the proposed layout is the introduction of bicycle lanes in both directions; some stretches getting an additional 2- or 3-foot buffer against moving traffic. The 2011 East Falls Church Area Plan calls for bike lanes along the entire stretch of Washington Boulevard through the master plan area. The 2008 Bicycle Element of the Master Transportation Plan (MTP) also calls for bike lanes in the same area.

The final plan as submitted to VDOT provides a number of benefits, including:

- Helping stitch together the expanding Capital Bikeshare system (a new station was installed at the East Falls Church metro station in 2016 and two new stations will be installed in Westover in 2017 and 2018);
- Connecting existing bicycle lanes on Washington Boulevard between the Westover neighborhood and Lacy Woods Park neighborhood;
- Creating a nearly two-mile stretch of bicycle lanes from N Sycamore Street to George Mason Drive;
- The narrowing of unnecessarily wide travel lanes to help calm traffic;
- Installing a dedicated left turn lane for westbound Washington Boulevard at N Ohio Street to help reduce backups;
- Improving pedestrian comfort on sidewalks due to buffering provided by the new bicycle lanes; and
- Pedestrian safety improvements at key intersections with highly visible markings for crosswalks.

This project is currently undergoing construction.

East Falls Church Plan

The East Fall Church Plan was adopted in 2011 by the County Board and designated the area in the vicinity of the East Falls Church Metrorail station as the East Falls Church Neighborhood Center District.

The East Falls Church Plan built on recommendations made by the citizen task force including:

- Preserving single-family areas and historic and natural resources;
- Providing opportunities for new open spaces and neighborhood-serving retail, including a grocery store;
- Limiting building heights to four to six stories along building frontages, with specific height guidance for the park-and-ride site up to nine stories;
- Outlining goals and strategies for attaining affordable housing units;
- Considering financing options for a new West Entrance to the Metrorail station;
- Reducing auto congestion and limit spillover parking impacts;
- Improving bicycle and pedestrian safety and connectivity;
- Enhancing bus service; and
- Studying improvements to I-66.

Major challenges in developing a plan for the area were connecting both sides of I-66 through better bicycle and pedestrian facilities, addressing current and future traffic issues, and providing opportunities for mixed-use development that complements the character of the neighborhood.

Key elements of the plan include:

- A “Neighborhood Center” vision for that includes preserving the surrounding single-family neighborhoods, preserving and creating new open spaces, providing opportunities for additional neighborhood-oriented retail and enhancing pedestrian and bicycle connections to the Metrorail station;
- A new mixed-use development node at the existing 422-space park-and-ride site to include: ground floor retail, a pool of 100 to 200 shared public parking spaces priced to favor short-term parkers, a public open space and continuation of existing bus operations;

- New public open spaces adjacent to the W&OD Trail near Lee Highway;
- A new west entrance to the East Falls Church Metrorail station to make the station more accessible from proposed development along Lee Highway and Washington Street in the City of Falls Church; and
- Street improvements including new lane configurations, addition of on-street bicycle lanes, on-street parking (where possible), and intersection enhancements to increase pedestrian safety and reduce speeding and merging conflicts.

Neighborhood Conservation (NC) Projects

The Neighborhood Conservation (NC) Program helps improve and enhance Arlington neighborhoods. When the program was created in 1964, the goal was to empower residents by having them come together to discuss and share ideas for improving their neighborhoods. Today, the program provides funding for a variety of improvements including: installation of sidewalks, curbs and gutters, streetlights, signs, park improvements, neighborhood art and beautification. This program empowers citizens to identify and plan projects in their own neighborhoods

N Ohio Street / John Marshall Trail Improvements

This is a pedestrian safety and street improvement project on N Quintana Street from Washington Boulevard to 19th Street N. The project scope includes: (1) a new 5-foot wide concrete sidewalk being constructed along the east side of the street. It will narrow to 4-foot in width at one location to protect a mature tree; (2) a utility/buffer (grass) strip, located adjacent to the sidewalk; (3) LED Carlyle-style streetlights replacing existing DVP-owned Cobra streetlights; (4) storm water drainage improvements within the project limits; (5) the street width narrowing to 28 feet at the northerly end of the project limits, closer to Washington Boulevard, and on-street parking will be retained along both sides; and (6) the street width being narrowed to 22 feet at the mid- to southerly parts of the project limits, and on-street parking being retained along the east side only. The narrowed roadway will maintain two travel lanes, one in each direction, but will be considered a yield street.

N Ohio Street / John Marshall Trail Improvements

The segment of N Ohio Street from 22nd Street N to Washington Boulevard will be improved to include sidewalks, crosswalks, and curb ramps that meet Arlington County and

ADA standards. In addition, LED streetlight improvements may also be implemented in the future.

22nd Street N Improvements

The street improvement project on 22nd Street N from N Kentucky Street to N Lexington Street proposes to construct a curb and gutter where there currently is none on the north side of the street. The project scope also includes a proposed curb extension with bio-retention basin on 22nd Street N, adjacent to the property located at 5709 N 22nd Street.

Patrick Henry Drive Street Improvement Project

This is a neighborhood pedestrian safety and beautification project to install curb extensions at Washington Boulevard at Patrick Henry Drive; curb extensions at 15th Street N, with double handicap-accessible ramps on the west side of Patrick Henry Drive to accommodate mid-block crossing; curb extensions at 16th Street N and N Lexington Street; bump-out entrance into parking area of Westover Apartments on the west side of Patrick Henry Drive; the installation of 5-foot bicycle lanes on the west side of Patrick Henry Drive from Washington Boulevard to 16th Street N; 5-foot sidewalk along several locations; yellow painted dividing stripe on Patrick Henry Drive, and re-orienting parking on the west side at the Westover Apartments to be 60 degree back-in parking. Travel lanes will be 10 feet on both sides of Patrick Henry Drive.

N Illinois Street Improvements

Pedestrian safety and street improvement project on North Illinois Street from 22nd Street N to Lee Highway. The project scope includes: (1) design and installation of a new 5-foot continuous sidewalk, with a 2.5-foot utility/buffer strip, curb, and gutter on the west side of the street; (2) continuous curb and gutter on the east side of the street; (3) ADA compliant pedestrian ramps throughout the project area; and (4) curb extensions at the intersections of N Illinois Street with N 22nd Road, N 23rd Street, and N 24th Street.

24th Street Improvements

This is a neighborhood pedestrian safety and beautification project on 24th Street N, from N Illinois Street to N Kensington Street. The project scope includes: (1) installing a continuous 5-foot sidewalk, curb and gutter, and associated storm water infrastructure, on the south side of 24th Street N; (2) on-street parking being retained on both sides of 24th Street N; (3) ADA compliant pedestrian ramps being installed at the intersections with N Illinois Street and N Kensington Street; and (4) New

Carlyle style streetlights installed in the new 2.5-foot utility/buffer strip adjacent to the sidewalk.

Based on industry standards, some of the infrastructure improvements identified above were included in this report's future traffic models. The Traffic Operations chapter of this report details which projects met standards for inclusion, and how future changes were assumed and incorporated into the analysis.

Potential Developments

There is one (1) potential development project in the vicinity of the site, which was considered for inclusion as part of this study. Figure 6 identifies the location of this development.

Virginia Hospital Center Expansion

In 2015, Virginia Hospital Center (VHC) proposed the expansion of the hospital on an adjacent parcel of land at 1800 N Edison Street. Generally known as the Edison Site, the 5.6-acre site was owned by the County at the time.

VHC intends to incorporate the Edison Site into their existing, adjacent campus for a total site area of 21.6 acres. VHC's rezoning, site plan amendment, and use permit amendment applications propose to:

- Rezone Edison Site from "S-3A" to "S-D";
- Replace existing buildings on Edison Site with a new 7-story medical office building and an 8-story parking garage; and
- Convert 120,000 square feet of medical office use on the current VHC campus to hospital use.

The Site Plan Review Committee, including members of the Planning Commission and representatives of other advisory commission and nearby civic associations, will meet to review the proposed development plans in 2018.

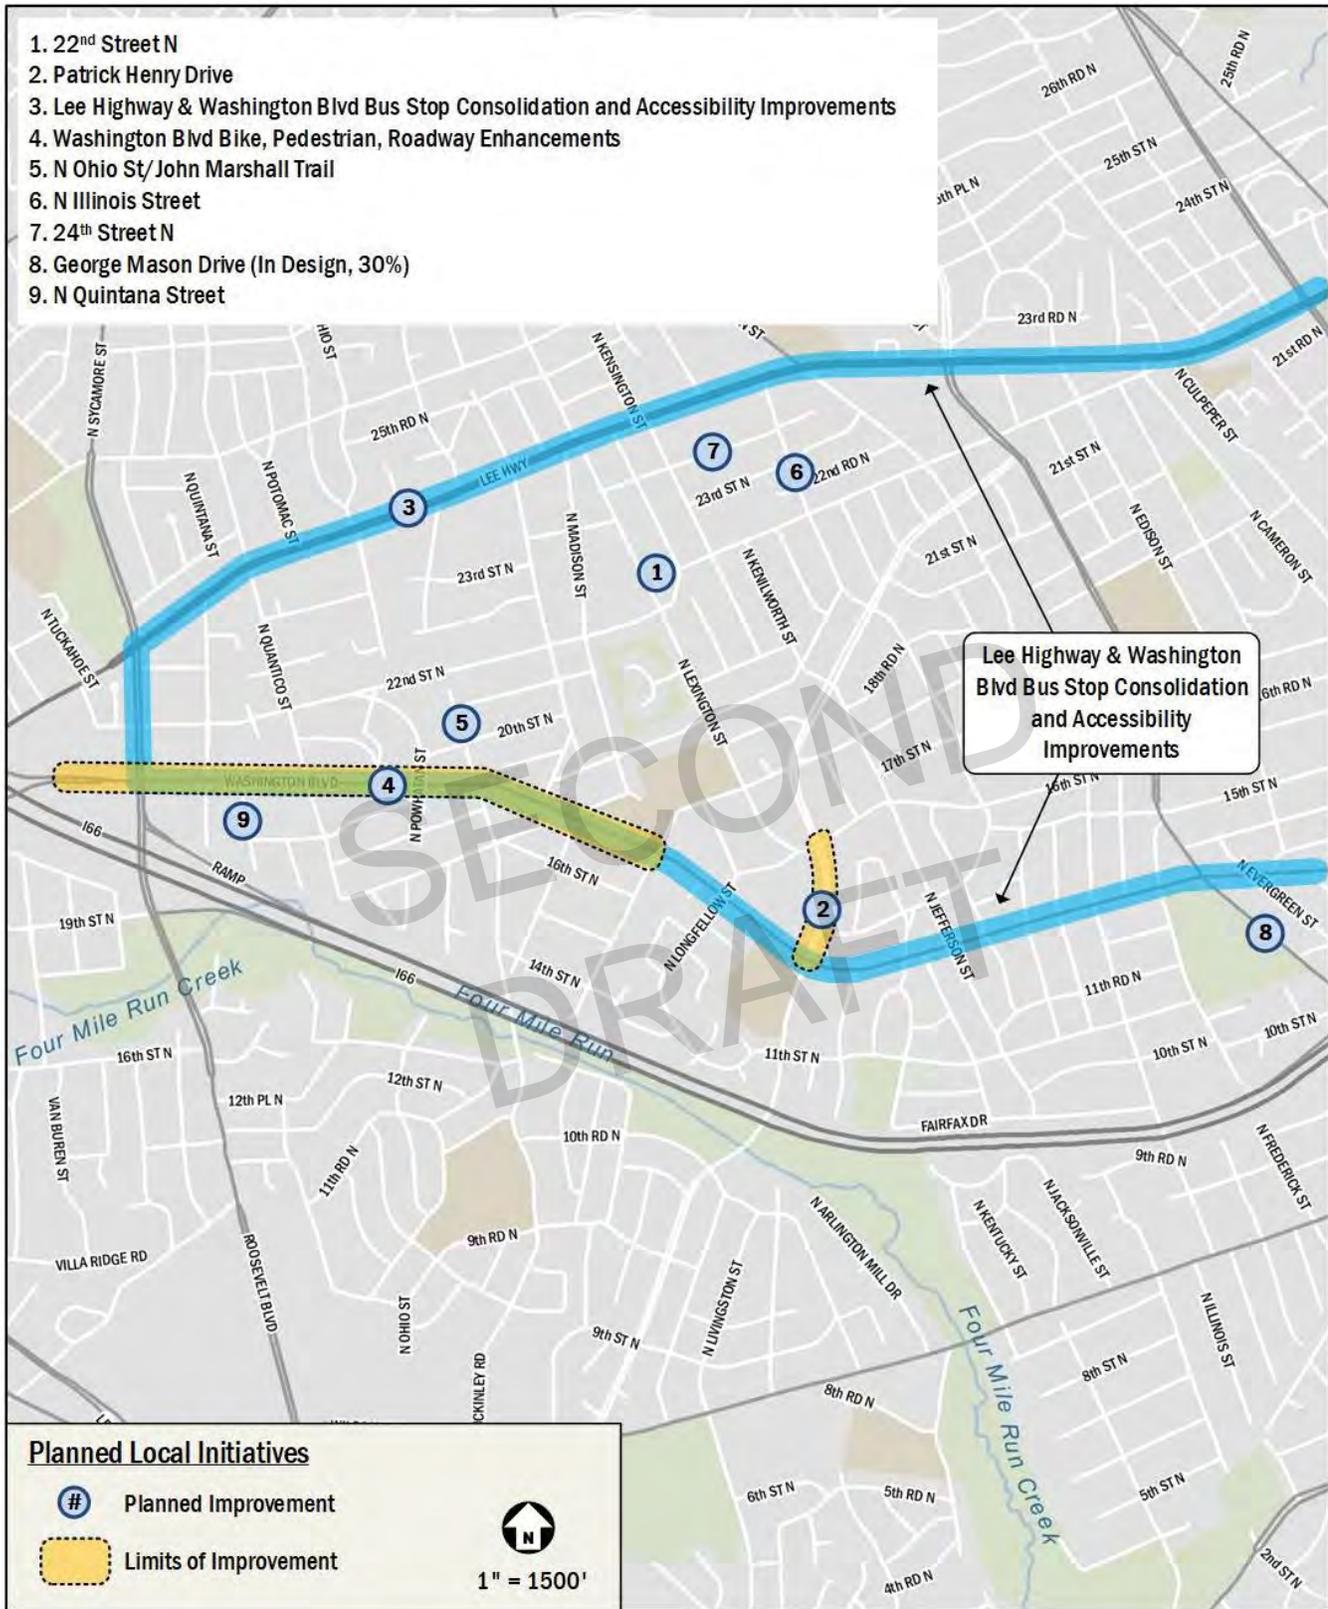

Figure 5: Map of Local Initiatives

Figure 6: Map of Nearby Developments

PROJECT DESIGN

This section reviews the transportation components of New Elementary School (ES) at the Reed site project. This includes an overview of how the site will be accessed by its various users, and how each mode is accommodated.

The New ES at Reed project consists of creating a new neighborhood elementary school, with a capacity of 732 students, to be opened for the start of the 2021-2022 school year. The Reed site was selected for a new neighborhood school in the APS Strategic Plan. This report is based on a conceptual design approved by the School Board and developed by APS, the design team, and the BLPC (Building Level Planning Committee) and PRFC (Public Facilities Review Committee).

The project is currently in schematic design, and thus specific details are likely to change. It is not anticipated that major transportation site elements will change, such as parking lot locations or driveways. Changes will likely be limited to slight differences in the total number of parking spaces in the expanded parking lots.

PROJECT OVERVIEW

The current Reed site is home to:

- The Westover Library, a local branch of the Arlington Public Library
- The Children's School, a non-profit daycare and pre-school focused on serving APS staff (with approximately 120 students)
- Integration Station, APS' preschool for special education students (with approximately 26-32 students)
- A recreational area with several athletic fields

The conceptual plan to add an elementary school for the site demolishes the building currently housing The Children's School and Integration Station. The Westover library will remain, and the athletic fields will be reconfigured but remain on the site. An overview of changes to the Reed site is presented in Figure 8.

SITE ACCESS AND PARKING

Current vehicular access to the site is located on the Northwest parking lot behind the library, which accommodates APS and

library staff parking, and a general parking lot on 18th Street, which is used primarily by visitors to the Reed site.

Future vehicular access will remain similar to existing. The Northwest parking lot will be expanded but will remain a staff parking lot. This is because the location of the Northwest lot, off 18th and Madison Streets, is accessed via residential streets and 18th Street's intersection with Washington Boulevard is unsignalized. Since access to the parking lot is less intuitive and doesn't offer drivers a lot of routing choices, it is best used by staff instead of visitors (and especially parents picking-up and dropping-off students).

The 18th Street lot will also be expanded, and will accommodate visitor parking, staff parking not accommodated in the Northwest lot, and a student drop-off/pick-up loop and queuing area. In addition to being expanded, the 18th Street lot will remove one of its curb cuts and switch to a one-way loop circulation out of the same curb cut. This allows for more space for queuing and decreases a pedestrian/vehicular conflict point near the front door of the school.

The conceptual design was based on projected transportation demands, which are detailed in the next chapter of this report. In summary, the site was designed to accommodate:

- Parking demand of 45 spaces for the library, and 119 spaces for the New ES
- Queuing room for 30 cars at the student drop-off and pick-up area
- Space for 7 school buses to load and unload students

Figure 9 and Figure 10 present a summary of future site access.

Library Access

Library staff and volunteers will park in the expanded Northwest lot. This report recommends that 15 spaces within that lot have signage reserving spaces for the library, since the library opens later than the new ES.

Library patrons will have access to visitor parking in the expanded 18th Street lot. This report recommends that the visitor parking within the 18th Street lot is signed to prevent being used by staff. It is also anticipated that many library patrons will park on the street adjacent to the library, as they do today.

New ES Access

Staff for the new ES will park in the expanded northwest lot, the expanded 18th Street lot, and on-street adjacent to the Reed site. Although most staff parking will be accommodated on the Reed site, some parking is expected to occur on-street. This represents a compromise between minimizing impacts to the surrounding neighborhood with providing green space and recreation facilities on site. A detailed review of parking, and potential impacts is included in a chapter later in this report.

School buses will be accommodated on street on McKinley/18th Streets in front of the building near the front door. There is room for seven buses. This report reviewed bus maneuverability on McKinley/18th Streets and found that buses need to cross the yellow line in front of the Reed site. Figure 7 highlights this issue and a potential solution involving a slight adjustment to the double yellow center line.

Drivers dropping-off students the morning and picking them up in the afternoon will do so in the expanded 18th St lot. A dedicated loop and queuing space for this activity will be incorporated in the lot. The queuing space can accommodate around 30 vehicles, which is sufficient to handle the anticipated demand.

LOADING

The New ES's loading facilities are anticipated to remain where they are today, on the northwest side of the building adjacent to the Northwest lot. Design of the loading dock is currently being performed as part of the schematic design phase.

BICYCLE FACILITIES

The amount of location of bicycle racks on the Reed site will be determined as part of schematic design. The bicycle facilities chapter later in this report presents recommendations on the types and location for on-site bicycle parking.

TRAVEL DEMAND ASSUMPTIONS

This section outlines the transportation demand of the proposed new ES at the Reed site. This includes a review of APS Go! survey information, expected mode splits for staff and students, vehicular trip generation, parking demand and estimates of queuing space needed for school buses and parent drop-off/pick-up.

MODE SPLIT

The main source of mode split information for this report was APS Go! survey data collected in 2016. These surveys included all APS schools and consisted of multiple surveys including student tallies, parent surveys, and staff surveys. Not only do these surveys include mode split questions, but they also asked many other relevant questions where the responses were used to help assemble assumption for this report (e.g. arrival and departure times for staff).

APS Go! data for the student tallies and parent surveys were reviewed to help establish assumed modes splits for the New ES at the Reed site. Table 1 summarizes the morning mode split data from these surveys, and Table 2 contains the afternoon mode split survey results. The surveys were summarized in three categories, (1) all APS elementary schools, (2) all APD neighborhood schools (since the New ES will be a neighborhood school), and (3) just the results for the closest neighborhood elementary school to the Reed site, McKinley ES.

After comparing the summaries of survey information, this report decided to base assumptions on the student tallies over the parent surveys, as it appeared they were a more accurate reflection of mode splits. Based on the parent responses, they were overestimating the amount of times they would walk their children to school compared to how much they actually drive their children to school.

A similar summary of mode splits was performed for staff using the APS Go! data, the only difference being that the two closest APS facilities to the Reed site were averaged as comparable locations, McKinley ES and Swanson MS. This information is summarized in Table 3.

Table 1: Student Morning Mode Split Survey Results

| Population & Source | Morning Mode Split | | | | | |
|-----------------------------------|--------------------|---------|------------|------|------|---------|
| | Auto | Carpool | School Bus | Walk | Bike | Transit |
| All APS Elementary Schools | | | | | | |
| Parent Survey | 25% | <1% | 43% | 30% | 1% | <1% |
| Student Tally | 37% | 2% | 39% | 21% | 1% | <1% |
| APS Neighborhood ES | | | | | | |
| Parent Survey | 25% | <1% | 39% | 34% | 1% | <1% |
| Student Tally | 36% | 2% | 36% | 24% | 2% | <1% |
| McKinley ES | | | | | | |
| Parent Survey | 16% | 1% | 49% | 34% | <1% | <1% |
| Student Tally | 37% | 1% | 41% | 21% | <1% | <1% |

Table 2: Student Afternoon Mode Split Survey Results

| Population & Source | Afternoon Mode Split | | | | | |
|-----------------------------------|----------------------|---------|------------|------|------|---------|
| | Auto | Carpool | School Bus | Walk | Bike | Transit |
| All APS Elementary Schools | | | | | | |
| Parent Survey | 36% | <1% | 35% | 26% | 2% | <1% |
| Student Tally | 36% | 3% | 38% | 22% | 1% | <1% |
| APS Neighborhood ES | | | | | | |
| Parent Survey | 35% | <1% | 32% | 30% | 2% | <1% |
| Student Tally | 35% | 3% | 36% | 24% | 2% | <1% |
| McKinley ES | | | | | | |
| Parent Survey | 36% | 1% | 35% | 29% | <1% | <1% |
| Student Tally | 37% | 1% | 40% | 22% | <1% | <1% |

Table 3: Summary of Staff Mode Split Survey Results

| Population | Mode | | | | |
|---|------|---------|------|------|---------|
| | Auto | Carpool | Walk | Bike | Transit |
| All APS Staff | 85% | 3% | 4% | 3% | 5% |
| APS Neighborhood ES Staff | 84% | 3% | 5% | 2% | 6% |
| McKinley ES and Swanson MS Staff | 86% | 3% | 7% | 2% | 2% |

Based on the survey results above (including APS Go! survey information from school visitors), this report assembled baseline assumptions regarding anticipated mode splits for students, staff, and visitors at the New ES. These assumptions are summarized in Table 4.

Table 4: New ES Mode Splits (baseline)

| Population | Mode | | | | | |
|------------|------|---------|------------|------|------|---------|
| | Auto | Carpool | School Bus | Walk | Bike | Transit |
| Students | 38% | 0% | 36% | 24% | 2% | 0% |
| Staff | 86% | 3% | -- | 7% | 2% | 2% |
| Visitors | 81% | 2% | -- | 12% | 2% | 3% |

This report also used two other sets of mode split assumptions in its analysis, one that assumes enhanced Transportation Demand Management (TDM) measures that increase use of non-auto modes, and an inclement weather scenario that assumes many people that walk to school would drive or be driven instead. These mode splits, summarized in Table 5 and Table 6, were used in sensitivity analyses, to ensure that this report is making proper conclusions even when considering these alternate mode split scenarios. Mainly, the enhanced TDM scenario was used to base parking demand assumptions, and the inclement weather scenario used to help identify potential traffic impacts not foreseen under the baseline mode split.

Table 5: New ES Mode Splits (with Enhanced TDM)

| Population | Mode | | | | | |
|------------|------|---------|------------|------|------|---------|
| | Auto | Carpool | School Bus | Walk | Bike | Transit |
| Students | 33% | 0% | 36% | 27% | 4% | 0% |
| Staff | 81% | 5% | -- | 7% | 2% | 5% |
| Visitors* | 81% | 2% | -- | 12% | 2% | 3% |

*Enhanced TDM measures are not expected to affect visitor mode splits

Table 6: New ES Mode Splits (with Inclement Weather)

| Population | Mode | | | | | |
|------------|------|---------|------------|------|------|---------|
| | Auto | Carpool | School Bus | Walk | Bike | Transit |
| Students | 43% | 0% | 36% | 19% | 2% | 0% |
| Staff | 81% | 3% | -- | 2% | 2% | 2% |
| Visitors* | 86% | 2% | -- | 7% | 2% | 3% |

PARKING DEMAND

The future Reed site will generate parking demand from three sources: the library, the New ES, and the recreation fields. The

library and New ES will have their parking demand peak during the same time, during an afternoon on a school day. Although the fields will generate parking demand, it will not overlap with parking demand generated by the New ES. Thus, this report focused on projecting the parking demand peak on a weekday afternoon when the New ES parking demand is highest and overlaps with library parking demand. Table 7 summarizes the parking demand estimates for the future Reed site when parking demand peaks during a weekday afternoon.

Table 7: Parking Demand Summary

| Population | Parking Demand | |
|------------------|-------------------|-------------------|
| | Baseline | With Enhanced TDM |
| Library | | |
| Staff/Volunteers | 15 spaces | 15 spaces |
| Visitors | 30 spaces | 30 spaces |
| New ES | | |
| Staff | 120 spaces | 111 spaces |
| Visitors | 8 spaces | 8 spaces |
| Total | 173 spaces | 164 spaces |

The parking demand for the library was based on counts of existing parking on site and on adjacent streets, and information provided by library staff. The parking demand for the New ES is based on the expected staff population, mode split estimates, arrival and departure times from APS Go! data, and visitor surveys contained in the APS Go! data.

This report uses the parking demand with enhanced TDM as the design condition for the Reed site.

QUEUING DEMAND

This report assumes that the New ES will need to accommodate seven (7) school buses on site. This is based on the amount of school buses needed to serve comparable APS neighborhood elementary schools; it represents the higher end of buses needed at elementary schools.

The amount of queuing space needed parent drop-off/pick-up area was based on observations at other APS elementary schools and is estimated to range from 23 to 28 cars in the morning and 28 to 61 cars in the afternoon. These ranges vary due to the geometry and operations at the comparable locations observed. Because this project provides an opportunity to establish proper geometry and operational practices for the pick-up/drop-off area, this report recommends a design target of a 30-car queue length for the New ES.

TRIP GENERATION

The vehicular trip generation for this project takes into account the changes to the existing uses, and the addition of New ES traffic. First, the existing trips from the library, Children’s School and Integration Station are removed from the network. The trips removed are just those entering the existing the site at parking lots (i.e. they do not include traffic not parking on-site). Second, the library trips that were removed are added back to the network. The library trips were removed and added back because they will park in different locations after the New ES project is constructed. Finally, traffic generated by the New ES is added to the network.

The trip generation for the New ES is based on the population numbers of students and staff, the mode split assumptions summarized above (in Table 4), and transportation profiles based on APS Go! data (including arrival and departure times). The assumed bell times for the New ES were 9:00 AM to 3:41 PM, which match nearby elementary schools, but if offset from the closest public school, Swanson MS, which has bell times of 7:50 AM to 2:24 PM.

Using this information, a daily vehicular trip generation as determined for each user group. These are shown on Figure 11. Once these daily profiles were assembled, the morning peak hour, school dismissal peak hour, and evening commuter peak hour trip generations were assembled. Table 8 contains a summary of the project’s trip generation (for the baseline mode split scenario).

Table 8: Trip Generation Summary (baseline)

| User Group | Vehicular Trip Generation | | | | | | | | |
|--|---------------------------|-----------------|-----------------|---------------------|-----------------|-----------------|-----------------------|-----------------|------------------|
| | AM Peak Hour | | | PM School Peak Hour | | | PM Commuter Peak Hour | | |
| | IB | OB | Total | IB | OB | Total | IB | OB | Total |
| Step 1: Subtract existing trips (in and out of driveways into the site) from the network | | | | | | | | | |
| Library | 0 v/hr | 0 v/hr | 0 v/hr | -11 v/hr | -14 v/hr | -25 v/hr | -6 v/hr | -11 v/hr | -17 v/hr |
| Day Care | -50 v/hr | -33 v/hr | -83 v/hr | -17 v/hr | -19 v/hr | -36 v/hr | -37 v/hr | -54 v/hr | -91 v/hr |
| Total | -50 v/hr | -33 v/hr | -83 v/hr | -28 v/hr | -33 v/hr | -61 v/hr | -43 v/hr | -65 v/hr | -108 v/hr |
| Step 2: Add Library trips back to the network (library trips are removed and reapplied because they will be parking in different locations) | | | | | | | | | |
| Library | 0 v/hr | 0 v/hr | 0 v/hr | 11 v/hr | 14 v/hr | 25 v/hr | 6 v/hr | 11 v/hr | 17 v/hr |
| Step 3: Add trips associated with New ES | | | | | | | | | |
| Student Pick-up/Drop-off | 200 v/hr | 200 v/hr | 400 v/hr | 145 v/hr | 145 v/hr | 290 v/hr | 50 v/hr | 44 v/hr | 94 v/hr |
| Staff | 58 v/hr | 1 v/hr | 59 v/hr | 0 v/hr | 49 v/hr | 49 v/hr | 0 v/hr | 21 v/hr | 21 v/hr |
| Visitors | 3 v/hr | 0 v/hr | 3 v/hr | 3 v/hr | 4 v/hr | 7 v/hr | 0 v/hr | 1 v/hr | 1 v/hr |
| Total | 261 v/hr | 201 v/hr | 462 v/hr | 148 v/hr | 198 v/hr | 346 v/hr | 50 v/hr | 66 v/hr | 116 v/hr |
| Total net new Trips | | | | | | | | | |
| Library and New ES | 211 v/hr | 168 v/hr | 379 v/hr | 131 v/hr | 179 v/hr | 310 v/hr | 13 v/hr | 12 v/hr | 25 v/hr |

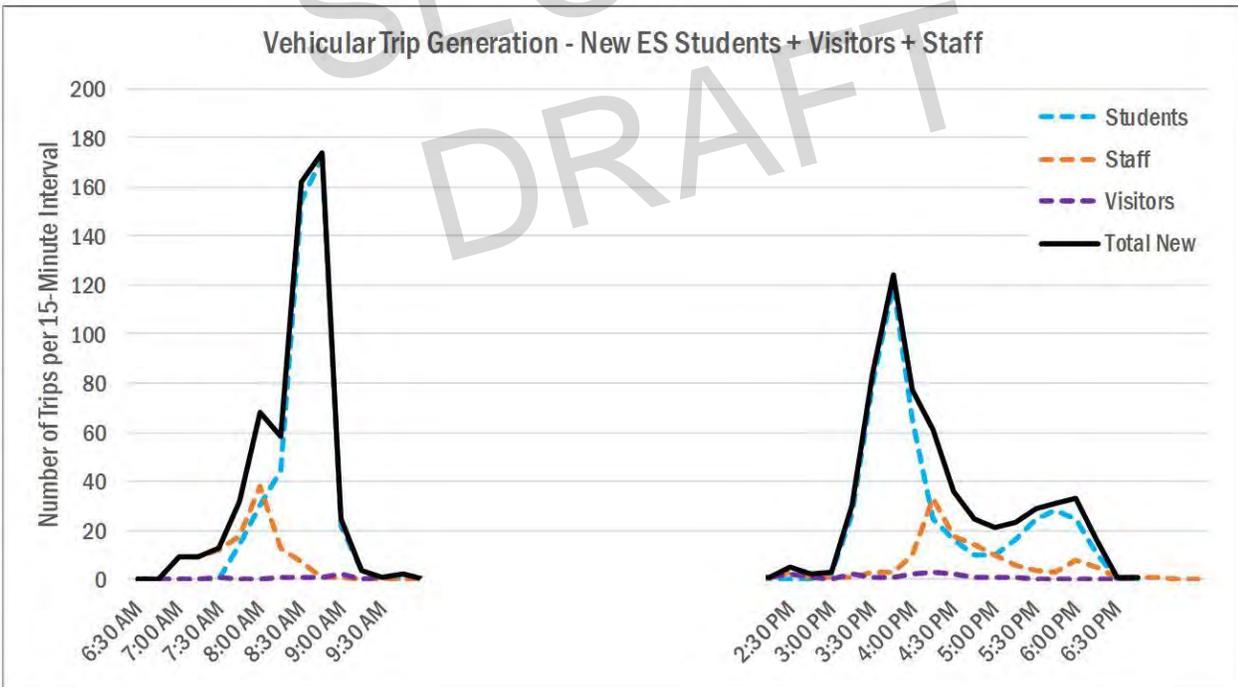

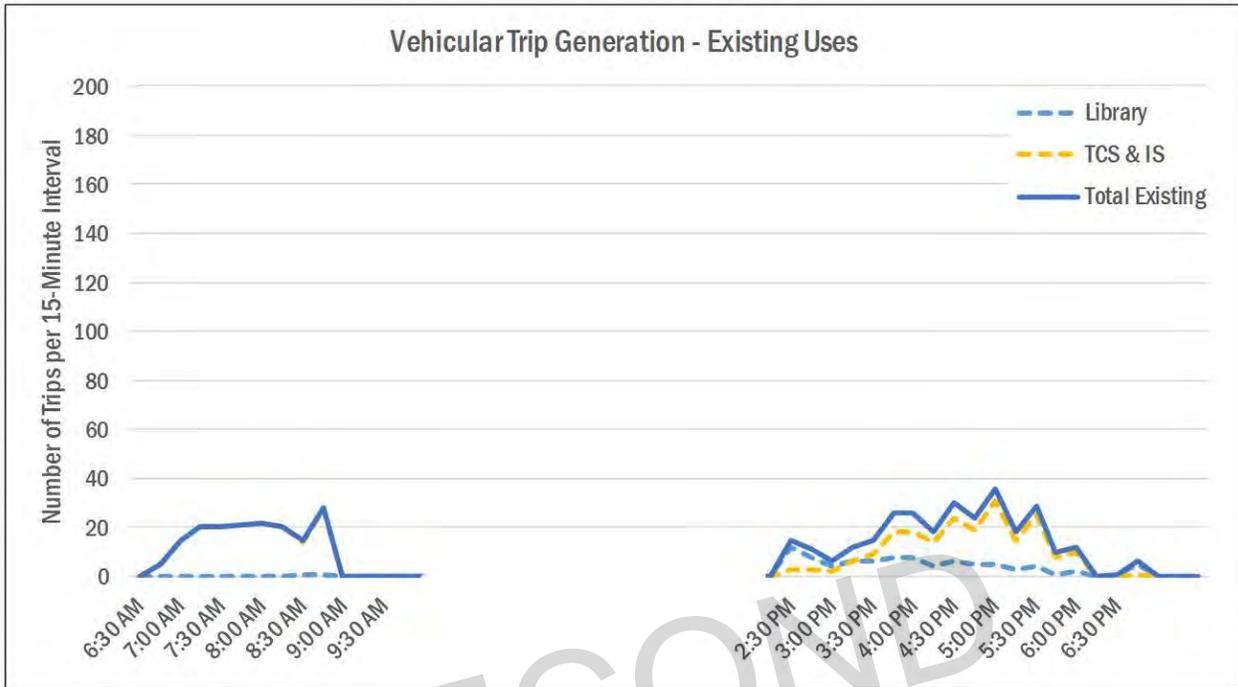

Figure 11: Vehicular Trip Generation Summary

TRAFFIC OPERATIONS

This section provides a summary of an analysis of the existing and future roadway capacity in the study area. Included is an analysis of potential vehicular impacts of the project and a discussion of potential improvements.

The purpose of the capacity analysis is to:

- Determine the existing capacity of the study area roadways;
- Determine the overall impact of the proposed project on the study area roadways; and
- Discuss potential improvements and mitigation measures to accommodate the additional vehicular trips

The following conclusions are reached within this chapter:

- The existing study area intersections all operate at acceptable levels of service and delay, with one exception. The southbound approach of 18th Street N to Washington Boulevard shows long delays as side street traffic waits for gaps in Washington Boulevard traffic. This condition is common for side streets with low traffic volume intersecting an arterial like Washington Boulevard.
- The future scenarios show similar results, with all study area intersections operating at acceptable levels with one exception.
- Traffic generated by the New ES has a negligible impact on the PM commuter peak hour.
- This report does not recommend any traffic mitigation measures for the proposed New ES
- A sensitivity analysis that explored different mode split scenarios for the New ES confirmed the findings of the baseline mode split scenario.

STUDY AREA, SCOPE, & METHODOLOGY

This section outlines the assumptions used to develop the existing and future capacity analyses, including volumes, roadway geometries and traffic operations. The scope of the analysis contained within this report was extensively discussed with and agreed to with Arlington County DES staff. The general methodology of the analysis follows national and County guidelines on the preparation of transportation impact evaluations of site development.

Capacity Analysis Scenarios

The vehicular analyses were performed to determine if the proposed development will lead to adverse impacts on traffic operations. (A review of impacts to each of other modes is provided later in this report.) This is accomplished by comparing future scenarios: (1) without the proposed project (referred to as the Background condition), and (2) with volumes generated by the project (referred to as the Total Future condition).

As per this report's scoping agreement, the roadway capacity analysis examined the following scenarios:

1. 2018 Existing Conditions
2. 2021 Future Conditions without project traffic
3. 2021 Future Conditions with project traffic

Each scenario contains three distinct hours of analysis, scenarios:

1. The AM commuter/school peak hour (in order to be conservative these hours were assumed to be the same)
2. The PM school peak hour
3. The PM commuter peak hour

Study Area

The study area is a list of intersections where detailed capacity analyses were performed for the scenarios listed above. They represent the intersections most likely to have potential impacts or require changes to traffic operations to accommodate the proposed project. Although it is possible that impacts will occur outside of the study area, those impacts are not significant enough to be considered a detrimental impact nor worthy of mitigation measures.

The study area intersections are based on the projected future trip generation and the location of site access points. As agreed to in this report's scoping agreement, the following intersections were included:

1. Washington Blvd/18th Street/N Nicholas St
2. Washington Blvd/McKinley Road
3. 18th Street N/Parking Lot Exit
4. 18th Street N/N Longfellow Street
5. 18th Street N/Parking Lot Entrance
6. 18th Street N/ N Lexington Street

7. 18th Street N/Patrick Henry Drive
8. N Lexington Street/18th Road N
9. N Lexington Street/19th Street N
10. 19th Street N/ N Madison Street
11. N Madison Street/18th Street N/Parking Lot

Figure 12 shows a map of the study area intersections.

Traffic Volume Assumptions

The following section reviews the traffic volume assumptions and methodologies used in the roadway capacity analyses.

Existing Traffic Volumes

The existing traffic volumes are comprised of turning movement count data, which was collected on Thursday, February 1, 2018. The results of the traffic counts are included in the Technical Appendix.

For the AM commuter/school and PM commuter peak hours, the system peak of the study area intersections was used. This was 7:30 AM to 8:30 AM for the AM peak, and 4:45 PM to 5:45 PM in the PM peak. For the PM school peak hour, the counts from 3:00 PM to 4:00 PM were used based on the anticipated trip generation from the New ES and the assumed afternoon bell time. The existing peak hour traffic volumes are shown on Figure 13.

2021 Background Volumes (without the Project)

The traffic projections for the 2011 Background conditions consist of the existing volumes with two additions:

- Traffic generated by developments expected to be completed prior to the project (known as background developments); and
- Inherent growth on the roadway (representing regional traffic growth).

Following national and local methodologies, a background development must meet the following criteria to be incorporated into the analysis:

- Be located in the study area, defined as having an origin or destination point within the cluster of study area intersections;
- Have entitlements; and
- Have a construction completion date prior or close to the proposed development.

Based on these criteria, and as discussed previously, no developments were included in the 2021 Background scenario. As described in the Study Area Overview chapter, the Virginia Hospital Center Expansion project does not meet these criteria. Traffic generated from that project is considered covered in the general background growth.

While the background developments represent local traffic changes, regional traffic growth is typically accounted for using growth rates. The growth rates used in this analysis are derived using trends in historical counts. Table 9 shows a summary of the growth in traffic volumes on roadways adjacent to the study area. Based on this analysis an annual growth rate of 0.2% was assumed.

Table 9: AADT Volume Trends

| Roadway | AADT | | | | | Annual % Change (2012 - 2016) |
|---|--------|--------|--------|--------|--------|-------------------------------|
| | 2012 | 2013 | 2014 | 2015 | 2016 | |
| 18th St N from N Longfellow St to Patrick Henry Dr | 930 | 990 | 980 | 970 | 950 | 0.5% |
| McKinley Rd from Washington Blvd to N Longfellow St | 2,600 | 3,500 | 3,500 | 3,400 | 2,600 | 0.0% |
| Patrick Henry Dr from Washington Blvd to George Mason Dr | 6,500 | 6,100 | 6,100 | 6,000 | 6,900 | 1.5% |
| Washington Blvd from Lee Highway to Patrick Henry Dr | 15,000 | 13,000 | 13,000 | 12,000 | 14,000 | -1.7% |

| 16th St N from Patrick Henry Dr to N Lexington St | 2,300 | 2,300 | 2,300 | 2,200 | 2,400 | 1.1% |
| Average | | | | | | 0.2% |

**Adjacent to proposed study area*

Source: VDOT Traffic Data 2012 to 2016

(<http://www.virginiadot.org/info/ct-trafficcounts.asp>)

The traffic volumes generated the inherent growth along the network were added to the existing traffic volumes in order to establish the 2021 Background traffic volumes. The Background peak hour traffic volumes are shown on Figure 14.

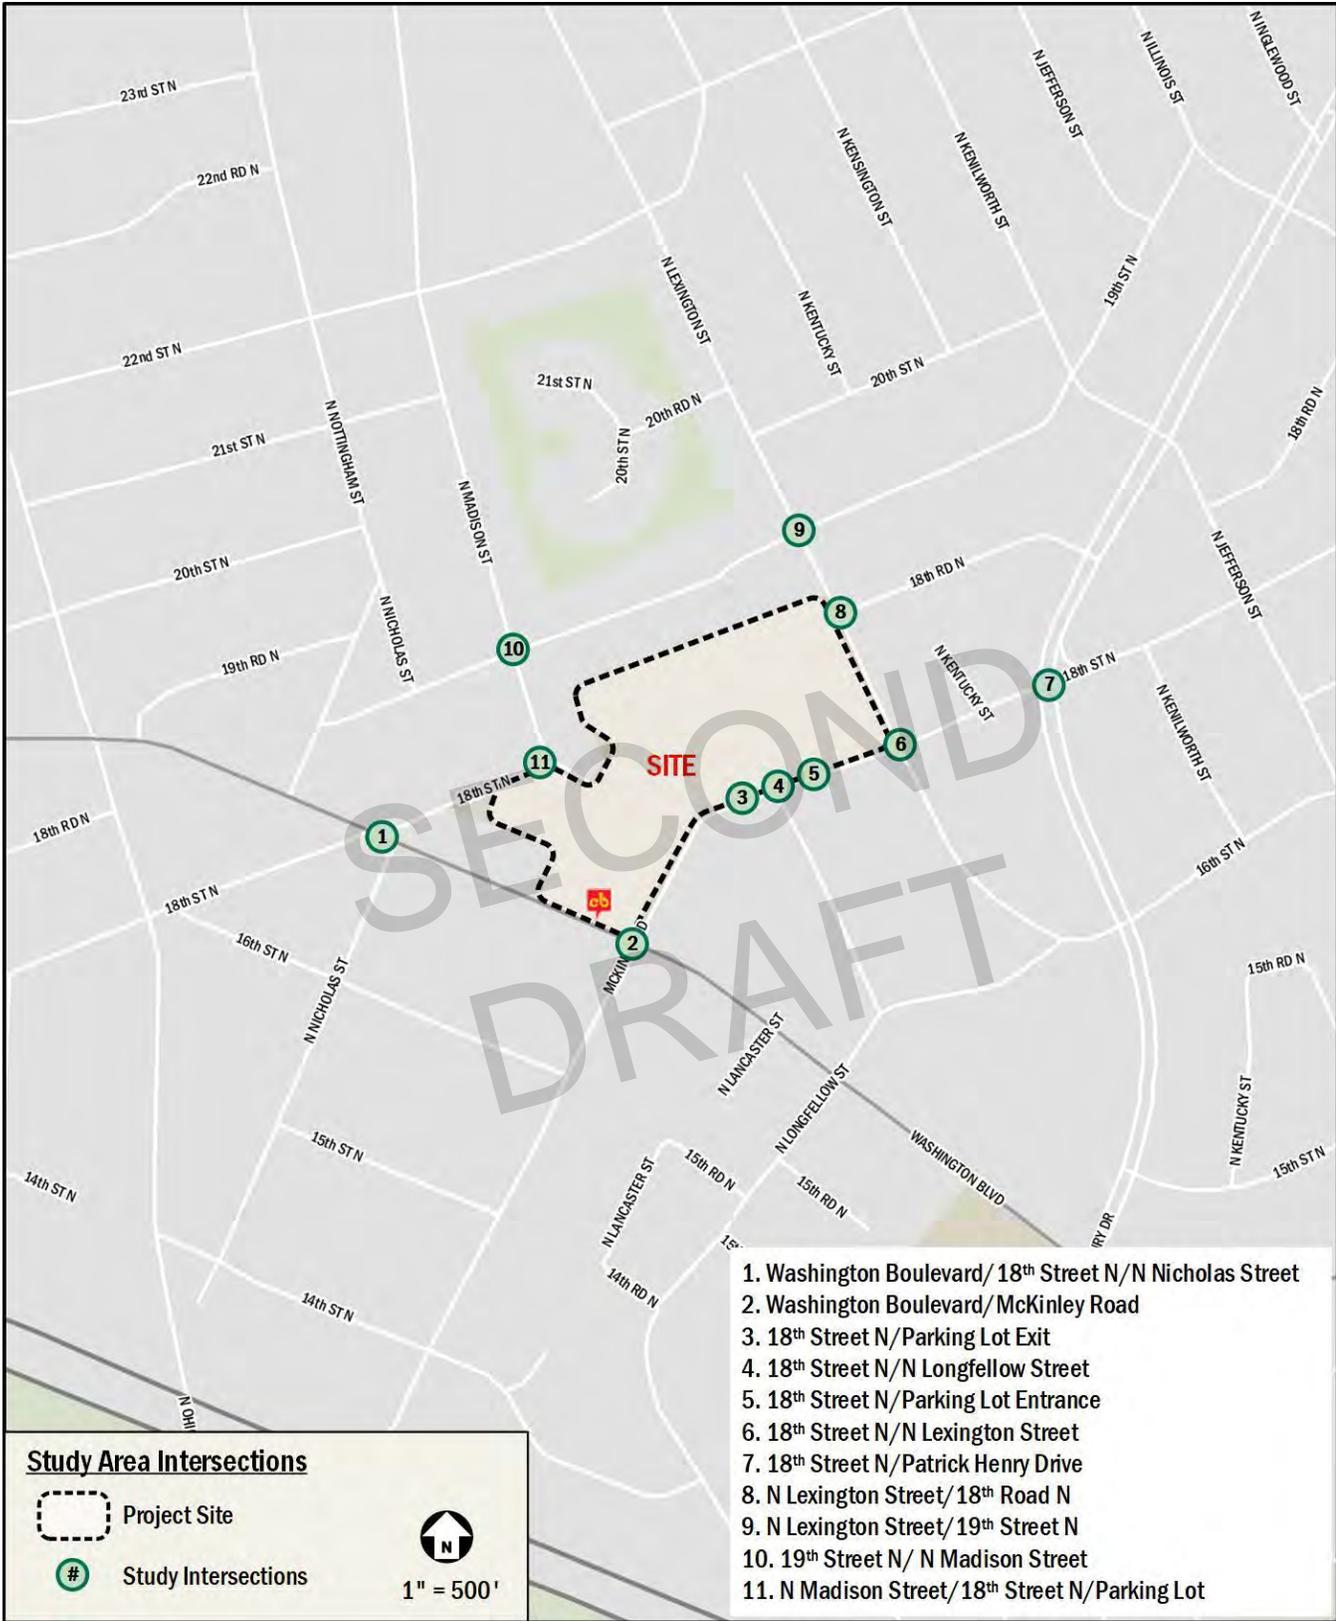

Figure 12: Study Area Intersections

Figure 13: Existing Peak Hour Volumes

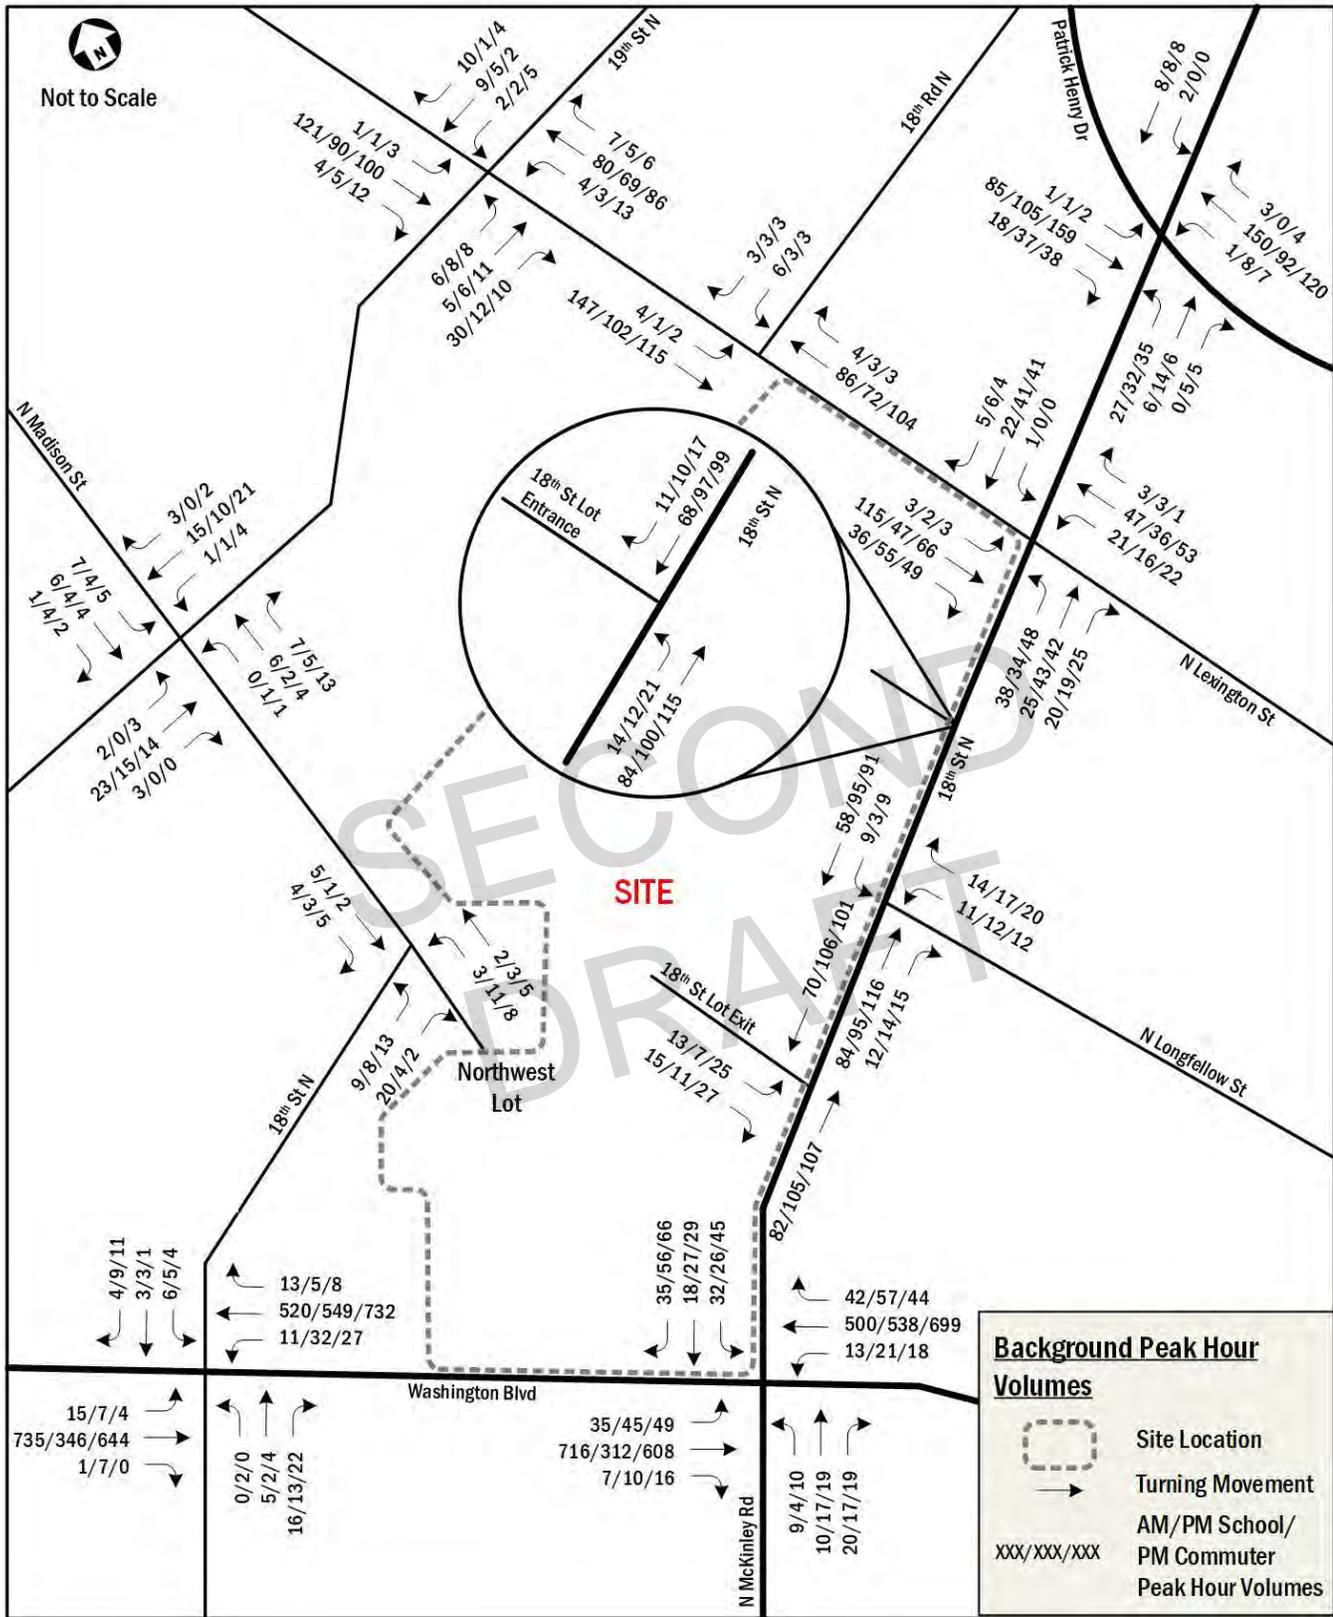

Figure 14: Background Peak Hour Volumes

2021 Total Future Volumes (with Project)

The 2021 Total Future Volumes consist of the 2021 Background volumes with the addition of the traffic volumes generated by the project. Thus, the 2021 Total Future traffic volumes include traffic generated by: the existing volumes, the inherent growth on the study area roadways, and the proposed project.

The proposed project's trip generation was presented in the Travel Demand Assumptions chapter of this MMTA. The trip generation was distributed and assigned in three steps. First, the existing trips from the library, Children's School and Integration Station are removed from the network. The trips removed are just those entering the existing site at parking lots (i.e. they do not include traffic not parking on-site). Second, the library trips that were removed are added back to the network. The library trips were removed and added back because they will park in different locations after the New ES project is constructed. Finally, traffic generated by the New ES is added to the network.

Distribution and routing assumptions are based on the location of APS Planning Units, traffic counts and existing volume patterns, and the Existing Conditions vehicular capacity analysis. Separate distributions for staff and parents were developed: Figure 15 shows the inbound and outbound trip distribution for staff; Figure 16 shows the trip distribution for local traffic, representing all trips that have origins and destinations in the local neighborhood; and Figure 17 shows the trip distribution for students which accounts for how some parents continue to work or return from work.

The traffic volumes for the 2021 Total Future conditions were calculated by adding the development-generated traffic volumes to the 2021 Background traffic volumes as per the steps listed above. Figure 18 shows the existing trips removed from the network. Figure 19 shows the library trips reapplied to the network. Figure 20 shows the New ES staff trips. Figure 21 shows the New ES student trips. Figure 22 shows the New ES visitor trips. Figure 23 shows the total trips generated by the New ES. Figure 24 shows the Total Future peak hour trips.

Geometry and Operations Assumptions

The following section reviews the roadway geometry and operations assumptions made and the methodologies used in the roadway capacity analyses.

Existing Geometry and Operations

Study area intersection geometry, lane configuration and additional infrastructure details were recorded at the time of the traffic counts and confirmed via field reconnaissance by Gorove/Slade.

For some intersections where wide travel lanes existing, observations were made on how traffic flowed through the intersection and the lane configurations adjusted. For example, on the westbound approach of Washington Boulevard to N McKinley Rd, there is technically only a single lane, but enough pavement width to fit two cars. Based on field observations this was coded in the traffic model as two lanes to better reflect actual conditions.

Traffic signal timings were provided by County staff and double-checked in the field. Figure 25 shows the Existing lane configurations.

2021 Background Geometry and Operations Assumptions

Following industry standard methodologies, a background geometry improvement must be funded and have a construction completion date prior or close to the proposed development.

Based on these criteria, a slight change was made to the intersection of Washington Boulevard and 18th Street N. The plans provided by the County for the Washington Boulevard Bike, Pedestrian, and Roadway Enhancement show that vehicles on Washington Boulevard turning right onto 18th Street N (in both directions) will have a small right turn lane available. This change was made for the 2021 scenarios. No changes to signal timings were made. Figure 26 shows the Background lane configurations.

2021 Total Future Geometry and Operations Assumptions

The 2021 Total Future geometry and operations assumptions include changes to accommodate the proposed modifications and expansion of the 18th Street parking lot. This includes removal of the 18th Street lot exit curb cut and moving the exiting traffic from the parking lot to the location of the entering curb cut, turning into a two-way driveway. No signal timing changes were made. Figure 27 shows the Total Future lane configurations.

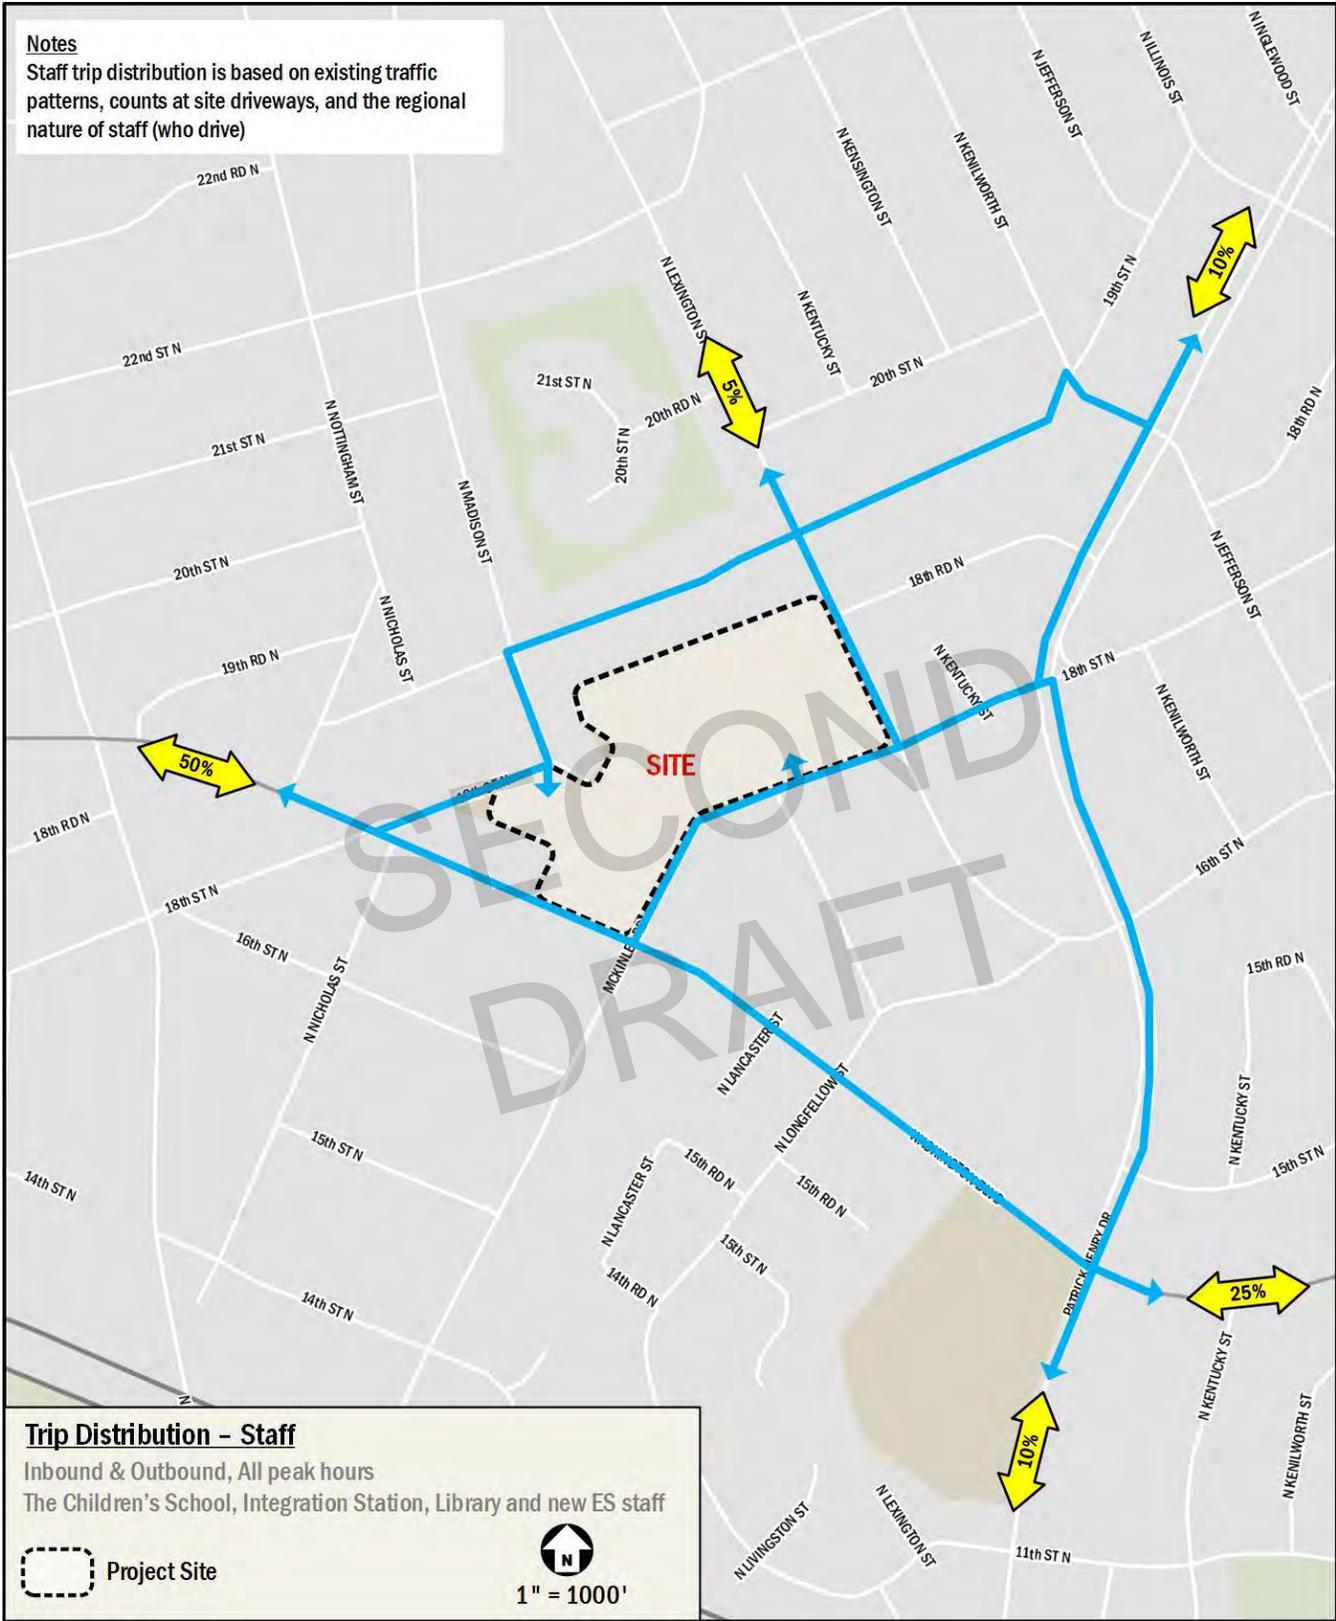

Figure 15: Staff Distribution

Notes

Distribution and routing assumptions are based on the location of APS Planning Units and the Existing Conditions vehicular capacity analysis results at study intersections. This local distribution is used for all trips expected to have origins/destinations in the local neighborhood (the new ES boundary).

VEHICULAR ANALYSIS RESULTS

Intersection Capacity Analysis

Intersection capacity analyses were performed for the three scenarios outlined previously at the intersections contained within the study area during the morning and afternoon peak hours. Synchro version 9.1 was used to analyze the study intersections based on the *Highway Capacity Manual* (HCM) 2000 methodology.

The results of the capacity analyses are expressed in level of service (LOS) and delay (seconds per vehicle) for each approach. A LOS grade is a letter grade based on the average delay (in seconds) experienced by motorists traveling through an intersection. LOS results range from “A” being the best to “F” being the worst. LOS D is typically used as the acceptable LOS threshold in the District; although LOS E or F is sometimes accepted in urbanized areas if vehicular improvements would be a detriment to safety or non-auto modes of transportation.

The LOS capacity analyses were based on: (1) the peak hour traffic volumes; (2) the lane use and traffic controls; and (3) the Highway Capacity Manual (HCM) methodologies (using *Synchro* software). The average delay of each approach and LOS is shown for the signalized intersections in addition to the overall average delay and intersection LOS grade. The HCM does not give guidelines for calculating the average delay for a two-way stop-controlled intersection, as the approaches without stop signs would technically have no delay.

Table 10 shows the results of the capacity analyses. Detailed LOS descriptions and the analysis worksheets are contained in the Technical Appendix

The results show that all study area intersections operate at acceptable conditions with one exception, the southbound approach of 18th Street N to Washington Boulevard.

At several locations within the study area, there are slight improvements between existing and future conditions. This is because of two reasons. First, the methodology used in the analysis assumes a minimum peak hour factor of 0.92 in the future analysis years. At some locations, this caused slight improvements in delay and LOS. Second, the removal of existing trips and application of library and New ES trips to the site resulted in some volume changes that lead to improved results in the Total Future condition. This is most apparent on the southbound approach of 18 Street N to Washington

Boulevard between Total Future and Background conditions. The Total Future conditions has slightly different volumes at the approach (notably fewer through volumes and more right turns). This leads to a decrease in delay.

Queuing Analysis

In addition to the capacity analyses presented above, a queuing analysis was performed at the study intersections. The queuing analysis was performed using Synchro software. The 50th percentile and 95th percentile queue lengths are shown for each lane group at the study area signalized intersections. The 50th percentile queue is the maximum back of queue on a median cycle. The 95th percentile queue is the maximum back of queue that is exceeded 5% of the time. For unsignalized intersections, only the 95th percentile queue is reported for each lane group (including free-flowing left turns and stop-controlled movements) based on the HCM 2000 calculations. HCM 2000 does not calculate queuing for all-way stops.

Table 11 shows the results of the queuing analysis. The queuing analyses show that all study intersections have acceptable queuing results, with all queues shorter than available storage lengths.

Mitigations

Based on County standards, the proposed project is determined to have an impact if any intersection or approach experiences a degradation to LOS E or F in the future scenario where one does not exist in the background scenario.

There is one location in the study area that meets this criterion, the southbound approach of 18 Street N to Washington Boulevard degrades from a LOS E to a LOS F in the AM peak hour scenario. After exploring potential mitigation measures for this location, this report is not recommending any, for several reasons. First, this condition is typical for side street traffic approaching an arterial at an unsignalized location. Second, the amount of volumes at the approach is very low and would not warrant a traffic signal. Third, potential improvements that would widen the intersection to provide more lanes could alleviate the poor LOS, but those improvements would have detrimental impacts to other modes. And finally, traffic delayed at this intersection can use the traffic grid to find other routes that don't experience this delay, by driving to an intersection with Washington Boulevard that has a traffic signal.

Additional Mode Split Scenarios

As stated in the Travel Demand Assumptions chapter, two additional mode split scenarios were developed for the New ES, an enhanced TDM scenario and an inclement weather scenario. The following presents a summary of a sensitivity analysis of the capacity analysis results that performs the same analysis but with these mode splits underlying the trip generation calculations.

These results show that the various mode split scenarios for the New ES all result in very similar results. The Enhanced TDM scenario results in the southbound approach of 18th Street N to Washington Boulevard having a LOS E in Total Future conditions, the same as existing conditions, and thus not requiring the exploration of mitigations. But this is mainly because the approach is right on the threshold between LOS E and F. This report does not see any reason to alter the findings and conclusions reached in the baseline capacity analysis results based on the sensitivity analyses.

PARKING

This section reviews the available parking surrounding the Reed site and presents parking recommendations, including:

- A summary of parking data collected in the area surrounding the Reed site on a typical weekday
- A review of existing peak parking demand for the existing uses on the Reed site, the nearby retail uses, and the surrounding residential streets
- A list of opportunities and concerns for accommodating anticipated demand from the new ES

The following conclusions are reached within this chapter:

- During a typical weekday, the existing parking demand adjacent to the Reed site is easily accommodated by the parking supply
- The adjacent retail area's parking supply peaks during the middle of the day with just over 70% occupied
- There is a potential that some New ES parking could occupy on-street spaces that would be better served for retail parking demand
- There is a significant amount of on-street parking on residential streets that could serve as parking supply for the New ES
- Curbside management strategies should be used to ensure that parking generated by the New ES that parks on street does so in these residential areas and not in on-street parking adjacent to the library or retail uses

EXISTING PARKING DEMAND

As part of this transportation report, detailed counts of parking supply and demand were conducted surrounding the Reed site.

The purpose of these counts was to determine the amount of parking supply and demand on streets within walking distance of the site and to identify trends or patterns associated with parking demand.

The area surveyed during this study, shown in Figure 28, represents an approximate 0.25-mile walk from the Reed site. Each block face in the study area was surveyed to determine whether parking is allowed and the approximate number of

spaces on the block face. Several off-street parking lots were also included in the study area.

The time and date of the parking data collection were selected based on the purpose of the counts. Since the information will be used to help determine parking supply needs for the new Elementary School, the date of the count was selected to represent a 'typical weekday', as school parking demand is highest during a school day when staff is parked on site. As such, parking data was collected in the study area on Tuesday December 12, 2017 from 6:00 AM to 10:00 PM. The parking demand sweeps were conducted every 30 minutes.

The parking data found a total of 1,395 parking spaces in the study area, the majority of which are unrestricted. The restricted parking is all adjacent to retail or library/school uses, such as patron parking in the commercial area on or adjacent to Washington Blvd, and 12 one-hour parking spaces on the northwest corner of McKinley Rd and Washington Blvd and the northeast corner of McKinley Rd and Washington Blvd. Most of the off-street parking lots were signed for specific uses, including the Northwest lot on the Reed Site, which is signed for Library/APS staff only from 6:00 AM to 4:30 PM Monday through Friday. None of the residential blocks in the study area had restricted (permit) parking.

The parking data found that the peak parking occupancy for the entire area occurred at 11:00 AM with an overall parking utilization of 38 percent (525 occupied of 1,395 available). The largest contributor to the peak is the commercial parking along Washington Blvd. Most other streets observed have an occupancy lower than 70% as seen on the map in Figure 29.

Tables and figures with parking demand for each period of data collection are contained in this report's Technical Appendix.

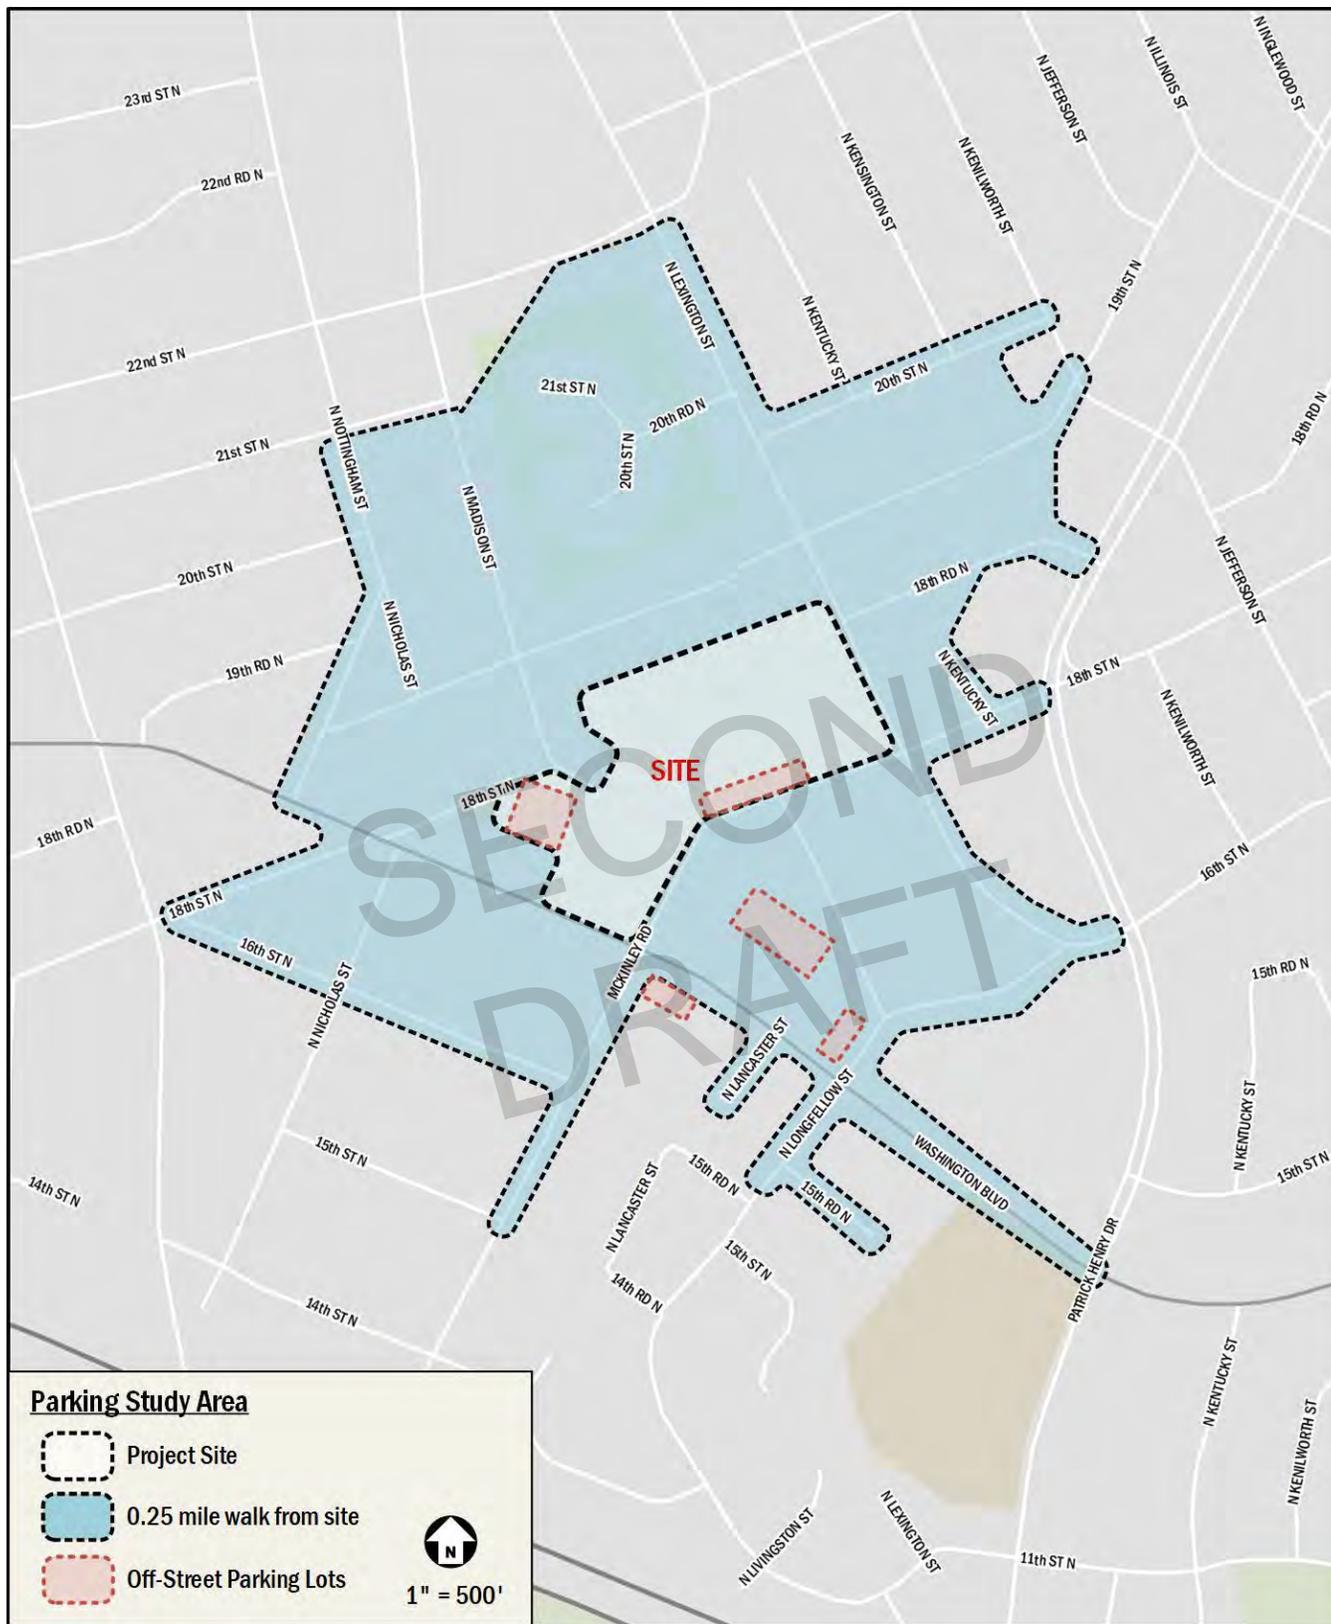

Figure 28: Parking Count Study Area

For purposes of reviewing the parking demand in more detail, the parking supply within the study area was broken down into three categories:

- **Site Parking**, which consists of the existing Northwest and 18th Street lots on the Reed site
- **Retail Parking**, which includes all retail/commercial off-street lots, and on-street parking on blocks that have retail and/or library uses on that block
- **Residential Parking**, which includes all on-street spaces on primarily residential blocks

Figure 30 shows these parking categories. Table 13 provides a review of each category’s peak parking demands. Figure 31 shows the overall and site parking demand over the course of the counts, while Figure 32 shows the retail and residential parking demand.

Table 13: Summary of Parking Demand

| Parking Type | Number of Spaces | Peak Demand |
|--------------|------------------|------------------------|
| Site | 72 | 81% at 2:30 PM |
| Retail | 267 | 72% at 12:30 PM |
| Residential | 1,056 | 38% at 6:30 AM/9:30PM |
| Total | 1,395 | 38% at 11:30 AM |

Site parking peaks at 2:30pm, with 81% of the 72 off-street spaces on the Reed site occupied. The lots on the Reed site peak during the middle of the day, which is logical considering the uses on site (day care/pre-school and public library).

The retail parking also peaked in the middle of the day, around lunch time. The retail parking is over 50% occupied throughout most of the day but drops in the evening around 6:30 pm.

Residential parking in the neighborhoods surrounding the Reed site is readily available, peaking at under 40% early in the morning and late at night. During the middle of the day, residential parking is mostly under 30% occupied.

SPOT COUNTS

Additional parking counts were conducted at a later date to help double check the results of the original parking count. This was done because the original count was performed on a Tuesday in December, with cold weather (partly sunny with a high of 48 degrees). Concerns were expressed that this may not capture typical demand because the library has popular

activities on Thursdays (e.g. story time), and the cold weather could impact parking demand. The secondary parking counts are referred as a ‘spot’ count because they were smaller in scope and duration. They did not cover as wide of an area, limiting the number of residential blocks counted, and they only were performed between 10:00 AM and 6:00 PM, since that time had already been demonstrated to be the peak of the uses within the study area.

The spot counts were performed on Thursday, April 12, 2018, when the weather was partly sunny with a high of 79 degrees. Figure 33 shows the area of the spot count and Table 14 provides a summary of the count and peak demand times. Figure 34 shows a comparison of the parking demand within the spot count area to the existing counts and a comparison of the off-street lots on site, while Figure 35 shows comparisons between the retail and residential parking (within the spot count area).

Table 14: Summary of Spot Count Parking Demand

| Parking Type | Number of Spaces | Peak Demand |
|--------------|------------------|---|
| Site | 72 | 86% at 10:30 AM |
| Retail | 267 | 76% at 12:30 PM 77% at 6:00 PM |
| Residential | 267 | 33% at 6:00 PM |
| Total | 606 | 52% at 12:30 PM 52% at 6:00 PM |

The spot counts show many similarities to the original counts, and a few differences. The main finding is that during the peak parking demand time for the New ES, 11:00 AM to 2:00 PM, the overall, site, and retail parking demands are very similar between the two counts. Thus, the main findings from the original counts regarding potential impact from the New ES are the same.

There are two differences between the original and spot counts. First, parking demand on site is a little higher before Noon, peaking at 10:30 AM. This is likely due to the event at the library (story time). This means that additional visitor parking for the library would be beneficial at that time.

Second, the amount of parking demand in the afternoon and early evening is slightly higher, notably for the retail parking. This means that the warmer weather may have an impact on parking in the area, although this does not coincide with the peak parking times for the New ES.

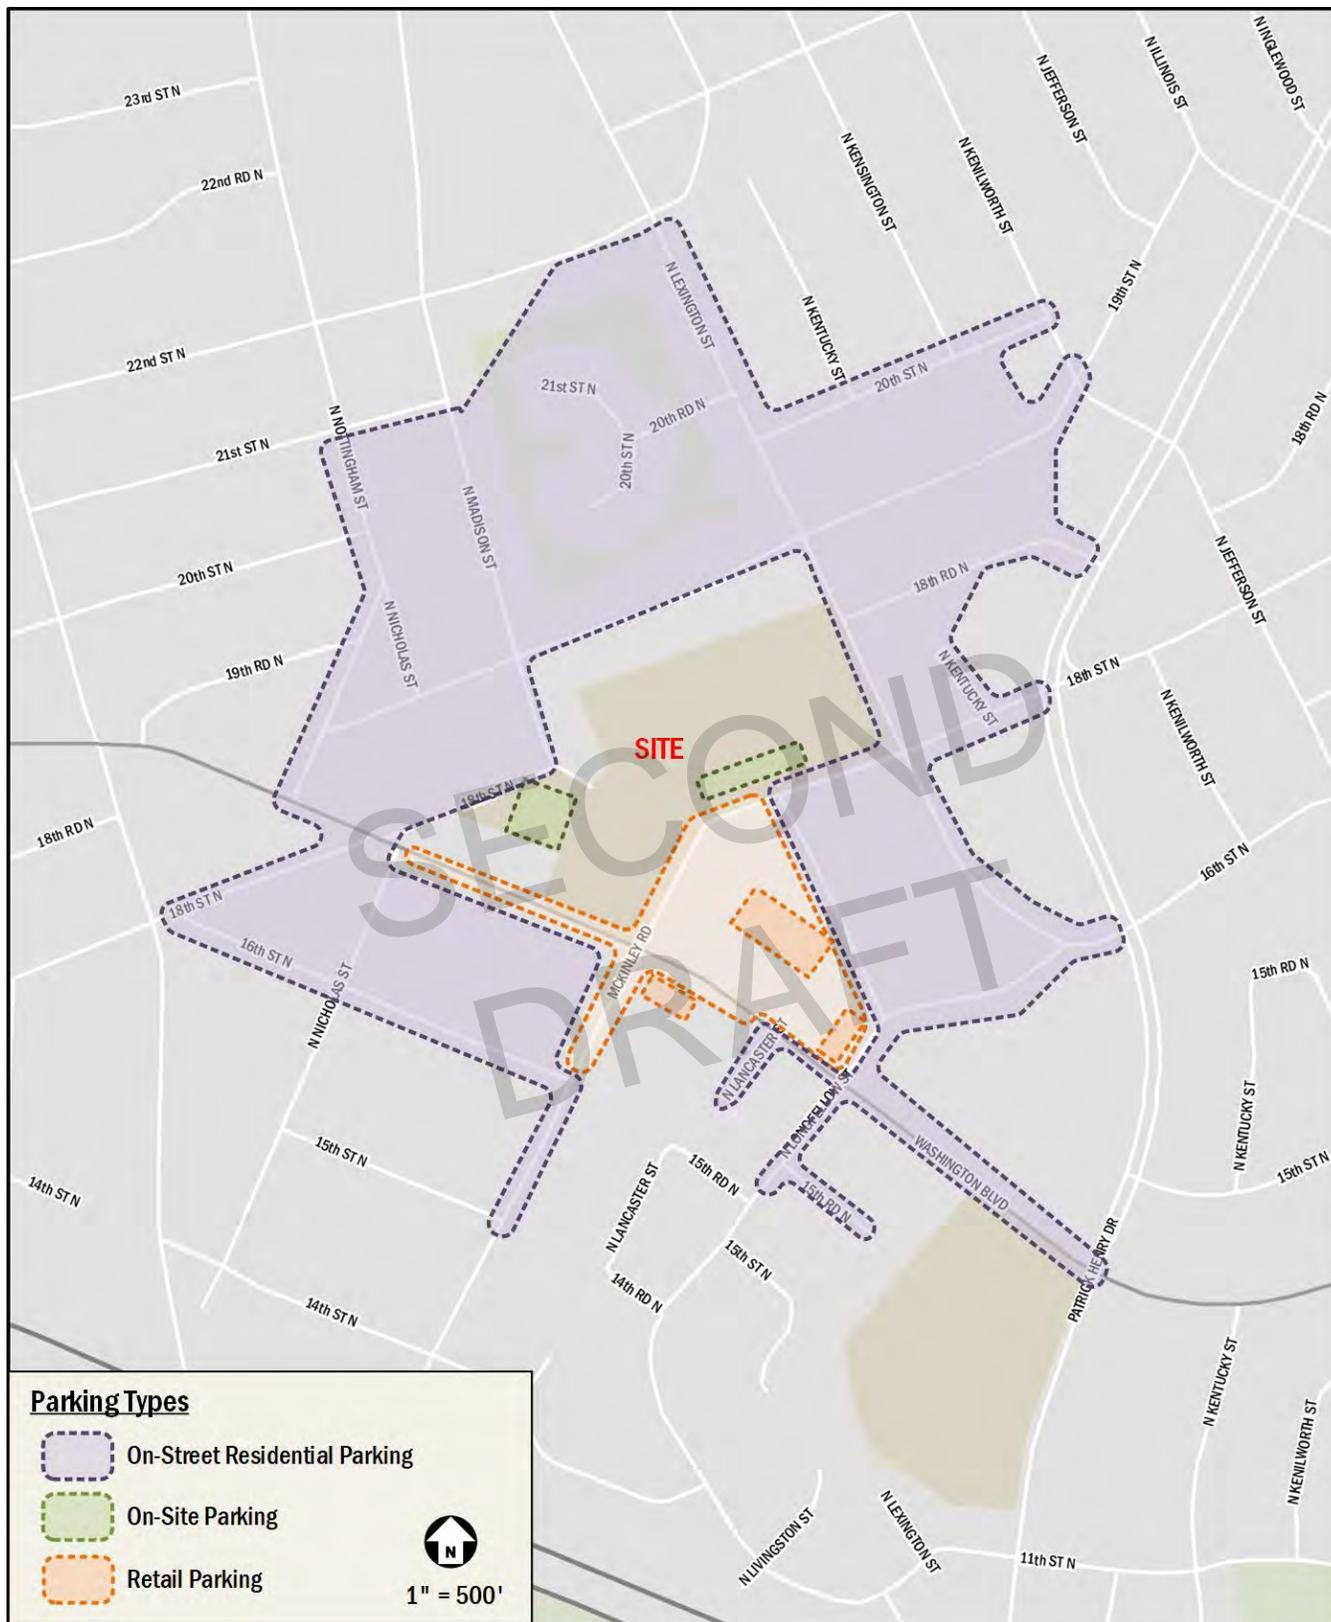

Figure 30: Parking Categories within Study Area

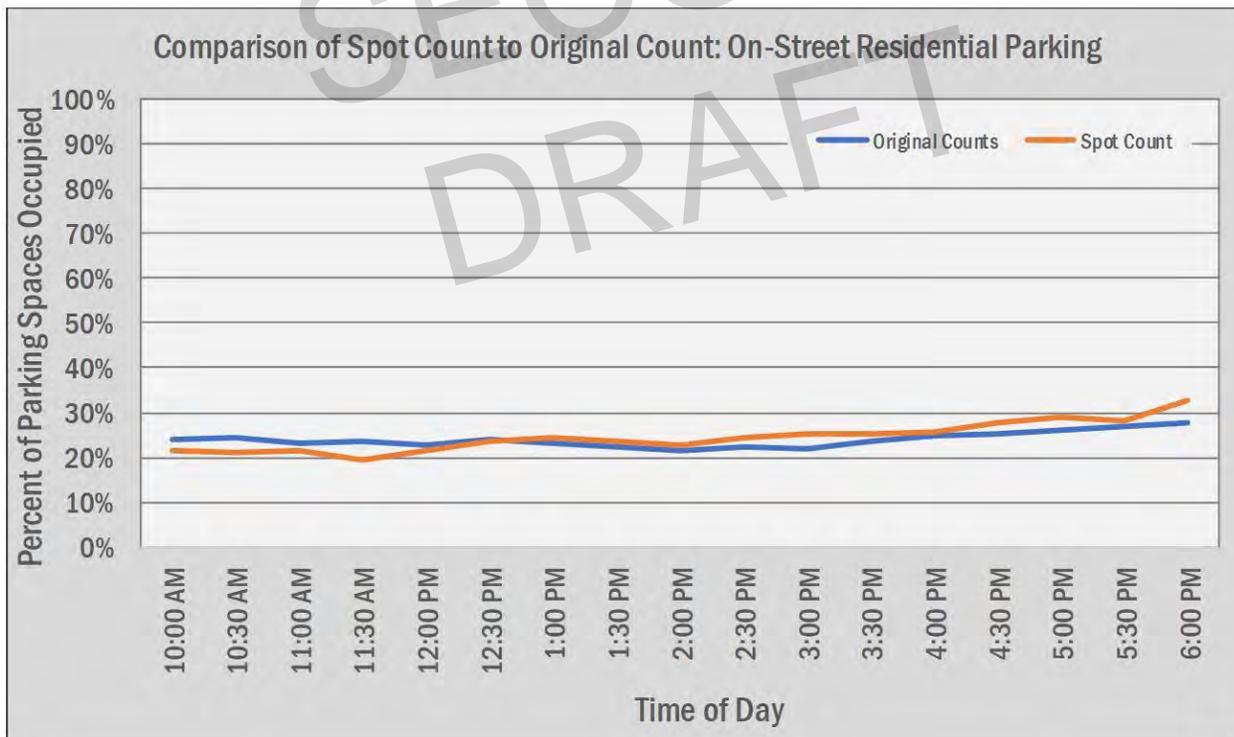

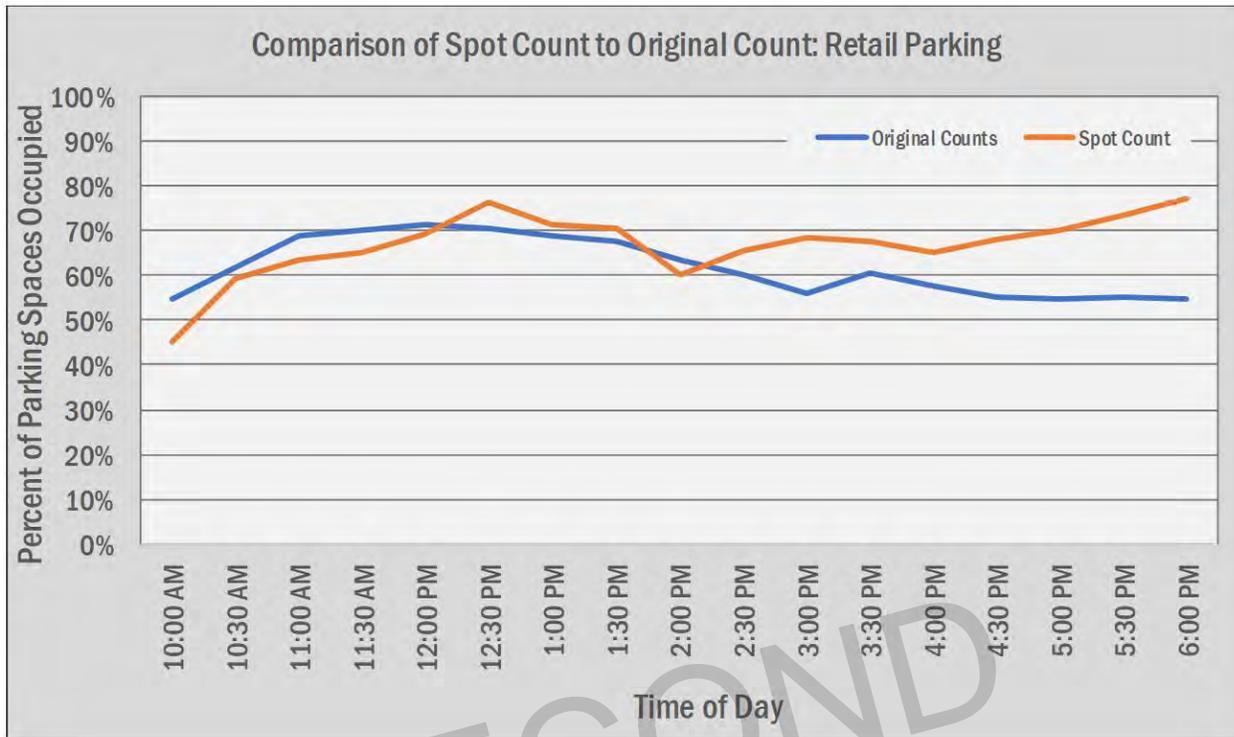

Figure 35: Spot Count Comparison, Retail and Residential

PARKING IMPACTS

Based on the parking data and counts, the potential impacts of building a New ES on the Reed site were reviewed and recommendations developed. This was done by comparing the anticipated peak demand of the New ES to the demands observed from the parking data for the existing uses on site and surrounding residential and retail. Then a list of recommendations was developed to minimize the impact of the New ES.

Parking demand of the New ES will peak in the middle of a school day, around 10 AM to 3:00 PM. This compares to other parking demand sources in the following manner:

- The library demand appears to be constant during operating hours from staff and patron parking, which overlaps the peak parking times for the New ES. The library's parking needs appear to peak during events at the library such as story time. Thus, the New ES and associated parking lots should maximize the ability to share parking between the New ES and the library in a manner that helps prevent library visitor parking from using other parking supplies.
- The recreation fields on site do not appear to have parking demand that overlaps with a typical school day. Although the fields do generate some parking demand, this occurs outside of school operating hours and can use the parking lots on the Reed site.
- Residential parking on surrounding streets in the neighborhood is readily available during the school day. The streets directly adjacent to the school could serve as a potential resource of parking supply for New ES staff and visitors.
- The retail areas adjacent to the Reed site generate parking demand that coincides with school peak parking demand. The parking data shows the retail parking peaking during lunch time. Thus, there is a potential for the New ES parking demand to impact retail parking supply. Additionally, there is an opportunity for retail parking demand to use school parking supply outside of school hours.

As stated in the Travel Demand Assumptions chapter, the expected parking demand at the future Reed site, during the peak of the school's parking demand, will be 164 vehicles, 45 for the library and 119 for the New ES. The Zoning requirement

for the site is 150 parking spaces, 33 for the library and 117 for the New ES. This report recommends that the amount of off-street parking built on site not meet either the anticipated demand nor the Zoning requirement. Instead, this report recommends that the New ES take advantage of the parking availability on surrounding neighborhood streets by using it as part of its parking supply.

A review of on-street parking on residential streets surrounding the site found that 20% of the approximately 150 spaces were occupied at 10 AM (this includes 18th Street between Longfellow and Lexington Streets, Lexington Street between 18th and 19th Streets, 19th Street between Lexington and Madison Streets, Madison Street between 18th and 19th Streets, and 18th Street between Madison Street and Washington Boulevard). Considering that based on aerial imagery, it appears that 70% to 80% of the houses on these streets have driveways, this report finds it reasonable that an additional 30 cars parking on these streets during a weekday, essentially doubling the occupancy from 20% to 40%, would be acceptable. Thus, this report assumes that up to 30 cars driven by New ES school staff will park on surrounding streets. Additionally, this report recommends that 10 on-street spaces in front of the library count be considered part of the supply for the 45-space parking demand for the library. Thus, out of the total demand of 164 parked cars, only 124 on-site off-street spaces will be necessary.

Based on the overlaps of parking demands with New ES, and in order to most efficiently use the parking provided on the Reed site while saving space for recreation fields, this report presents the following parking recommendations:

- Take advantage of the parking availability on surrounding neighborhood streets by using it as part of the parking supply for New ES staff.
- Based on a review of parking demand on residential streets adjacent to the Reed site, this report recommends that a maximum of 30 parked vehicles generated by the New ES should be parked off-site. Based on the parking demand calculations for the uses on site, this results in a minimum recommended parking supply on-site of 124 spaces. This report recommends that be the required minimum parking on site in lieu of the 150 spaces required by Zoning.

- Discourage New ES (and library) staff from parking in front of retail areas or the library, so that those spaces can be used by retail patrons and library visitors. Work with County staff on curbside management changes to on-street parking areas to deter staff parking in certain locations. For example, the parking in front of the library on Washington Boulevard is currently unrestricted. Switching it to time restricted (i.e. 2-hour) parking, would allow it to be used by visitors and patrons but not by employees.
- Utilize the New ES's area set aside for arrival drop-off and dismissal pick-up queuing for visitor parking at other times. This additional visitor parking could be used by the library, notably to boost the supply during events such as story time that do not coincide with school arrival or dismissal.
- Sign the expanded Northwest and 18th Street parking lots in a manner that encourages sharing outside of school operating hours. Use signs such as "APS and Library Staff parking only, Mon-Fri 6:00 AM to 4:30 PM, Public parking all other times".

SECOND
DRAFT

PEDESTRIAN FACILITIES

This section presents a review of pedestrian walking routes to and from the Reed site. The purpose of this review is to develop a set of recommendations for infrastructure and operational improvements to raise the potential walking mode split of students and staff at the New ES. The steps performed in this review included:

- A detailed review of infrastructure within a 0.25 mile distance of the site
- A detailed review of additional walking routes beyond 0.25 miles, based on potential walk zone boundaries for the New ES
- A review of crossing quality along walking routes across arterial roadways
- An examination of impacts that planned County projects would have on walking route quality

The following conclusions are reached within this chapter:

- Walking routes adjacent to the school generally meet County standards, with some exceptions to the south of the site in residential neighborhoods, and along sections of Washington Boulevard, Patrick Henry Drive, and 16th Street N
- Some targeted sidewalk improvements could help improve walking route quality, within the study area sidewalks can primarily be improved by adding sidewalks along expected walking routes that only have a sidewalk on one side of the street
- The presence of multiple signalized intersections along Washington Boulevard in the vicinity of the site provide safe crossing locations for pedestrians across an arterial. Each traffic signal provides adequate walk time for pedestrians crossing Washington Boulevard.
- Crosswalks on Patrick Henry Drive in the vicinity of the site do not meet County standards for crosswalk treatments, especially when considered as primary crossing points across an arterial
- Already planned infrastructure enhancements by the County on Washington Boulevard and Patrick Henry Drive will significantly improve pedestrian access to the site, especially at the intersection of Patrick Henry Drive and 16th Street N

- This report recommends that the placement of crossing guards be considered at the following intersections when the school opens:
 - Washington Boulevard and 18th Street N
 - Patrick Henry Drive and 18th Street N
 - Patrick Henry Drive and 16th Street N
 - N Lexington Street and 18th Street N

SIDEWALK REVIEW

The sidewalk review is an examination of sidewalks along expected walking routes to and from the New ES, comparing their sidewalk widths, buffer widths, and curb ramps to County standards. The sidewalk review for this report was performed for: (1) all facilities within a quarter-mile of the site, and (2) facilities along five (5) primary walking routes in the preliminary walkzone that APS developed for the New ES at Reed. Figure 36 shows the pedestrian study area that was evaluated as part of this MMTA.

The sidewalks, crosswalks, and curb ramps within the study area were evaluated based on the guidelines set forth by Arlington County. Table 15 summarizes the county width requirements for sidewalks and buffers by street type.

Table 15: Arlington County Sidewalk Requirements

| Street Type | Minimum Widths | |
|---|----------------|--------|
| | Sidewalk | Buffer |
| Neighborhood (Low Density) | 4' | 2' |
| Primarily Single-Family Residential Neighborhoods Arterial | 5' | 4' |
| Urban Center Local (Medium to High Density) | 6' | 4' |
| Primarily Retail Oriented Mixed-Use Arterial | 10' | 6' |

Comparisons of the pedestrian facilities within the study area to Arlington County standards are shown on Figure 37, Figure 38, and Figure 39.

Within one-quarter mile of the site, almost all of the roadways are considered neighborhood (low density). Washington Boulevard and Patrick Henry Drive are both arterials, with Patrick Henry Drive and some of Washington Boulevard being classified as Primary Single-Family Residential Neighborhood Arterials. Washington Boulevard between N Nottingham Street and N Longfellow Street is classified as a Primary Retail Oriented Mixed-Use Arterial. Most of the sidewalks surrounding the site meet County standards for sidewalk width

and buffer; however, there are exceptions. Firstly, there are areas to the in the residential neighborhood to the south of the site that lack sidewalks on both sides of the road. Secondly, while there are sidewalks and buffers present on both Washington Boulevard and Patrick Henry Drive, the sidewalk and buffer widths do not meet the minimum specified widths per County standards.

ADA standards require that all curb ramps be provided wherever an accessible route crosses a curb and must have a detectable warning. Additionally, curb ramps shared between two crosswalks is not desired. Under existing conditions there are curb ramps present at most intersections; however, many intersections have curb ramps that are shared by multiple crosswalks, which is undesired.

Outside of the quarter-mile walk area, the five extended walking routes show a similar level of quality. All have at adequate facilities, although not all of them meet standard. The exception is the extended walking route along 16th Street east of the site, which has acceptable sidewalks on its northern side, but no sidewalks on its southern half. It may be worthwhile for the County to explore adding sidewalks to the southern side of 16th Street N. A preliminary review of these streets shows that the width of the roadway would likely mean that adding sidewalks would come at the loss of on-street parking on that side of the street, or a similar trade-off. Such trade-offs would require further study and review between the County and affected residents.

In general, all of the walking routes along collector and arterial streets reviewed had sidewalks on at least one side of the street. Some neighborhood streets south of Washington Boulevard lack sidewalks on either side, but this is typical of many residential areas in Arlington County, and not as significant of a concern. Although it would improve the pedestrian experience to add sidewalks to cover these gaps, it is not something that has to be done for a school to work on the Reed site. Thus this report is not recommending that the school project implement any off-site pedestrian infrastructure improvements, but rather the County explore improving the gaps identified within this review in a separate process.

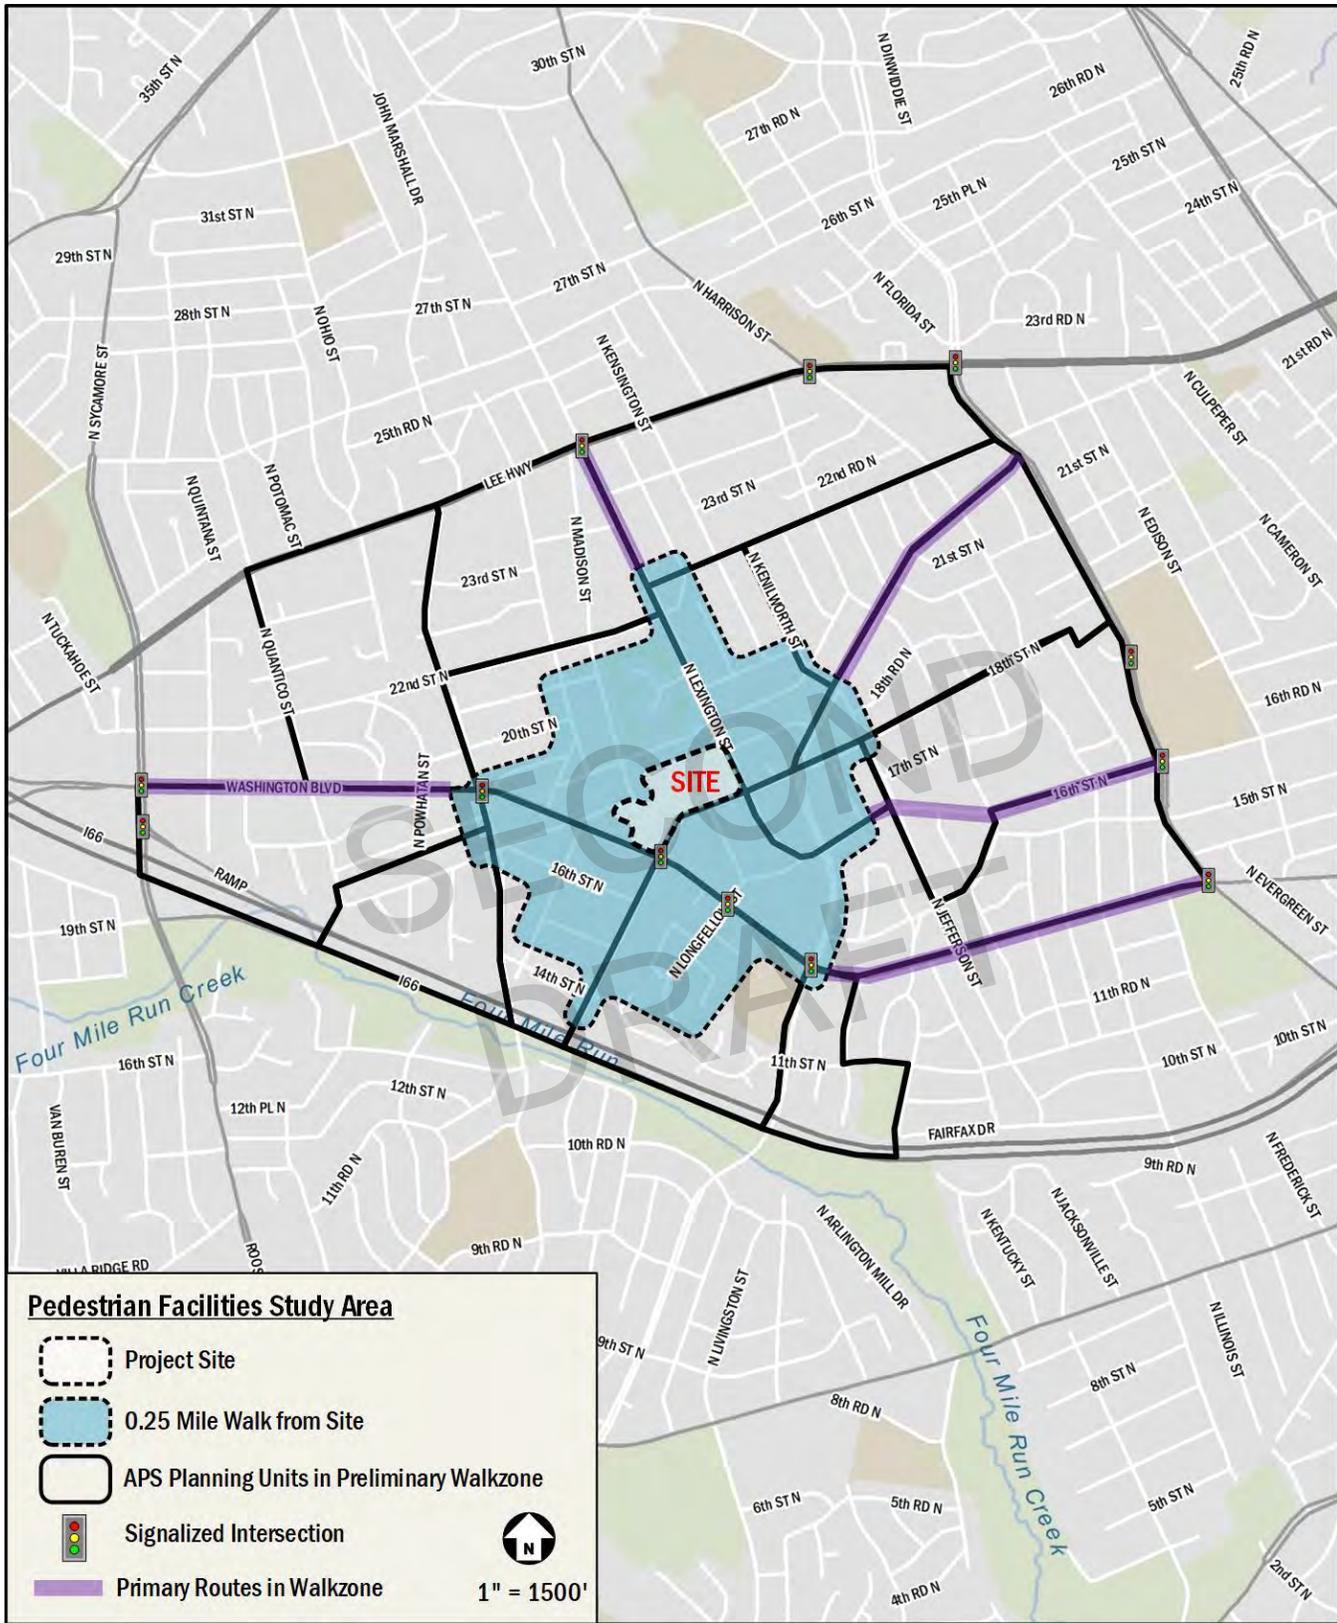

Figure 36: Pedestrian Study Area

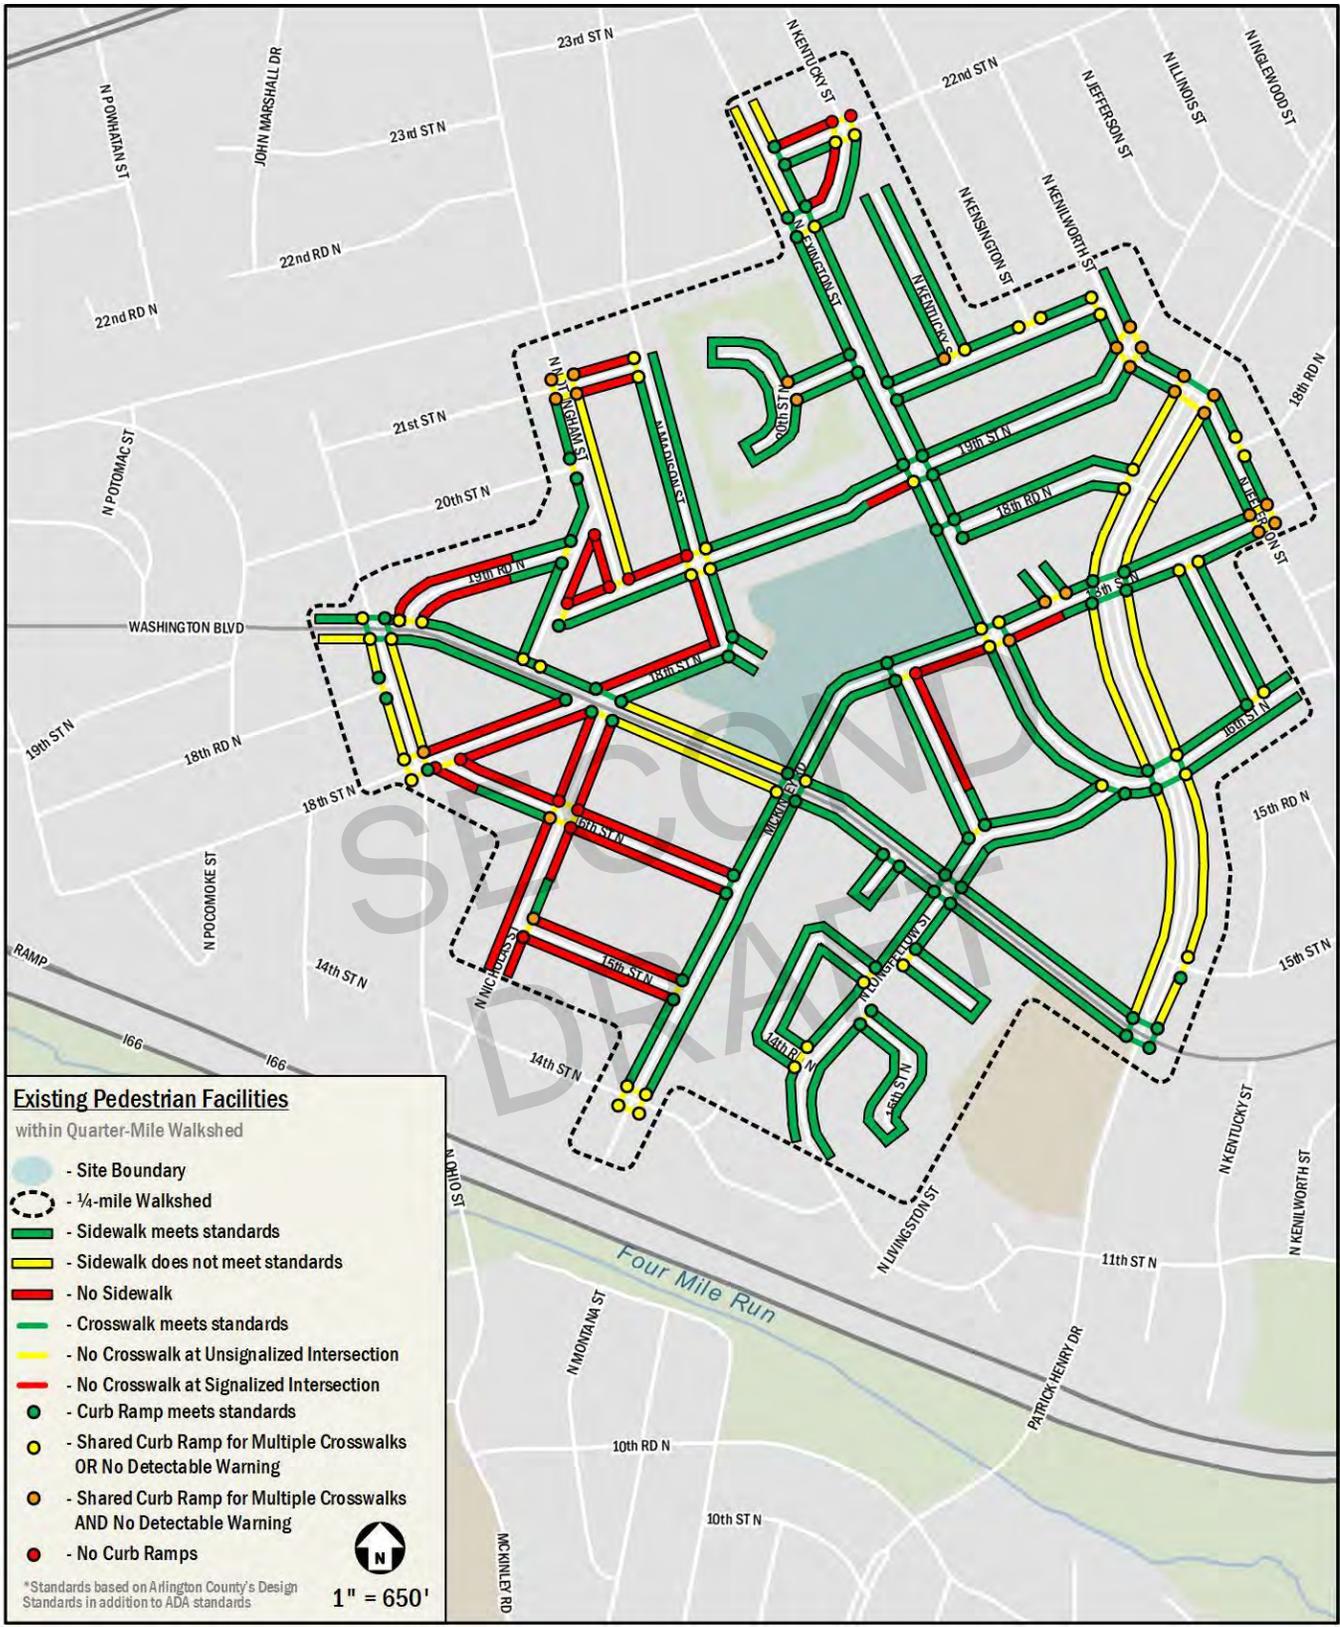

Figure 37: Existing Pedestrian Facilities (quarter mile)

CROSSING REVIEW

This section reviews the quality of crosswalks along walking routes that cross nearby arterials to the Reed site. The purpose of this review is to determine if students would be comfortable crossing arterials and what measures could be done to increase walking route quality.

Washington Boulevard

Washington Boulevard has several locations where pedestrians can cross at signalized locations with a 'walk/don't walk' pedestrian signal. The crossing review at these locations is based on ensuring pedestrians have sufficient time to cross when they get a 'walk' sign, by comparing the amount of walk time presented during the signal phases compared to the length of the crosswalk.

The main sources of data for this review were (1) crosswalk measurements taken using Arlington County's AC Maps, and (2) signal timing sheets provided by Arlington County (which show pedestrian walk and don't walk times). The required pedestrian crossing time was calculated by dividing the distance by an average walking speed of three (3) feet per second. Please note that the Virginia Department of Transportation (VDOT) and the *Manual on Uniform Traffic Control Devices* (MUTCD) assume an average pedestrian walking speed of 3.5 feet per second.

Table 16: Crossing Distance Analysis (Wash Blvd)

| Intersection Leg | Crossing Distance (ft) | Required Crossing Time (sec)* | Minimum Provided Crossing Time | |
|---|------------------------|-------------------------------|--------------------------------|----------|
| | | | AM (sec) | PM (sec) |
| Washington Boulevard and N Ohio Street | | | | |
| North Leg | 50 | 17 | 26 | 26 |
| South Leg | 58 | 19 | 26 | 26 |
| East Leg | 47 | 16 | 24 | 24 |
| West Leg | 68 | 23 | 24 | 24 |
| Washington Boulevard and N McKinley Road | | | | |
| North Leg | 39 | 13 | 23 | 23 |
| South Leg | 37 | 12 | 23 | 23 |
| East Leg | 59 | 20 | 23 | 23 |
| West Leg | 56 | 19 | 23 | 23 |
| Washington Boulevard and N Longfellow Street | | | | |
| North Leg | 32 | 11 | 23 | 23 |
| South Leg | 34 | 11 | 23 | 23 |
| East Leg | 53 | 18 | 22 | 22 |
| West Leg | 45 | 15 | 22 | 22 |
| Washington Boulevard and Patrick Henry Drive | | | | |
| North Leg | 63 | 21 | 25 | 25 |
| South Leg | 58 | 19 | 25 | 25 |
| East Leg | 52 | 17 | 27 | 27 |
| West Leg | 47 | 16 | 27 | 27 |

*assuming a pedestrian walking speed of 3 ft/sec.

The 3 second assumption was used instead to be more conservative, and account of the age of the students walking to and from the school. Please note that the Virginia Department of Transportation (VDOT) and the *Manual on Uniform Traffic Control Devices* (MUTCD) assume an average pedestrian walking speed of 3.5 feet per second.

Table 16 shows the results of the pedestrian crossing distance analysis.

Based on the results of the analysis, the closest signalized intersections to the site allow sufficient time for pedestrians to cross, even when accounting for the walking speed of children. Although Washington Boulevard carries a relatively high level of vehicular volumes, this report does not recommend infrastructure upgrades to its crosswalks. Instead, a crossing guard may be the more appropriate solution to help ensure students obey the 'walk/don't walk' signals at the intersection.

Patrick Henry Drive

In contrast to Washington Boulevard, the walking routes that cross Patrick Henry Drive all cross at unsignalized intersections.

This report reviewed the crosswalk quality using Arlington County's *Evaluation Criteria at Unsignalized Crossings*, which assigns crosswalk types based on an intersection's speed limit, geometry and vehicular volumes. All crossings meet their criteria except for some of the crosswalks along Patrick Henry Drive at its intersections with 18th Street N and 16th Street N. With a school being located nearby, the crossings now require high-visibility style (continental) crosswalk markings with road-side 'School Crossing' signage (currently the crosswalks over Patrick Henry Drive itself are not high-visibility and the school crossing signage isn't present).

Even with improved crosswalk markings, and County improvements mentioned later in this section, these may not be comfortable crossing locations for elementary age students, due to high speeds of cars, and grades and roadway curves that limit sight distance. These factors create a situation where typical solutions, such as curb extensions, and enhanced signing and marking cannot easily improve pedestrian comfort at the crosswalks.

Based on observations in the field, this report recommends that the New ES explore the use of crossing guards at Patrick

Henry Drive's intersections with 16th Street N and 18th Street N to help promote walking to and from the school.

PLANNED PEDESTRIAN INFRASTRUCTURE

This section reviews planned infrastructure improvements near the Reed site that could potentially alleviate some of the concerns noted above.

This review found significant planned enhancements to pedestrian facilities on Washington Boulevard and Patrick Henry Drive will address gaps in the system that are present under existing conditions. Figure 40 and Figure 41 show future pedestrian infrastructure conditions taking account the improvements listed below.

Washington Boulevard Bike, Pedestrian, Roadway Enhancements

The stretch of Washington Boulevard between Westover and East Falls Church is a VDOT owned and operated roadway. During the winter of 2016/2017, County staff developed a new striping and marking plan, with input from area property owners and community stakeholder groups, and VDOT will execute the work. Currently the road consists of two wide travel lanes and on-street parking through much of the corridor.

The most significant feature of the proposed layout is the introduction of bicycle lanes in both directions; some stretches getting an additional 2- or 3-foot buffer against moving traffic.

The final plan as submitted to VDOT provides a number of pedestrian benefits, including: (1) the narrowing of unnecessarily wide travel lanes to help calm traffic; (2) improving pedestrian comfort on sidewalks due to buffering provided by the new bicycle lanes; and (3) pedestrian safety improvements at key intersections with highly visible markings for crosswalks.

Although pedestrian comfort along Washington Boulevard will be improved, the planned sidewalk width still does not meet the minimum sidewalk widths in Arlington County for Primarily Retail Oriented Mixed-Use Arterials.

Neighborhood Conservation (NC) Projects

The following projects include pedestrian related improvements as part of Arlington County's Neighborhood

Conservation (NC) Program. Infrastructure improvements made through the County's NC Program generally include the installation of sidewalks, curbs and gutters, streetlights, park improvements and renovations, neighborhood art, beautification, traffic management, and pedestrian safety improvements.

N Ohio Street / John Marshall Trail Improvements

This is a pedestrian safety and street improvement project on North Quintana Street from Washington Boulevard to 19th Street North. The project scope includes: (1) a new 5-foot wide concrete sidewalk being constructed along the east side of the street. It will narrow to 4-foot in width at one location to protect a mature tree; (2) a utility/buffer (grass) strip, located adjacent to the sidewalk; (3) LED Carlyle-style streetlights replacing existing DVP-owned Cobra streetlights; (4) storm water drainage improvements within the project limits; (5) the street width narrowing to 28 feet at the northerly end of the project limits, closer to Washington Boulevard, and on-street parking will be retained along both sides; and (6) the street width being narrowed to 22 feet at the mid- to southerly parts of the project limits, and on-street parking being retained along the east side only. The narrowed roadway will maintain two travel lanes, one in each direction, but will be considered a yield street.

N Ohio Street / John Marshall Trail Improvements

The segment of N Ohio Street from 22nd Street N to Washington Boulevard will be improved to include sidewalks, crosswalks, and curb ramps that meet Arlington County and ADA standards. In addition, LED streetlight improvements may also be implemented in the future.

22nd Street N Improvements

The street improvement project on 22nd Street N from N Kentucky and N Lexington Streets proposes to construct a curb and gutter where there currently is none on the north side of the street. The project scope also includes a proposed bio-retention basin on 22nd Street N, adjacent to the property located at 5709 N 22nd Street.

Patrick Henry Drive Street Improvement Project

This is a neighborhood pedestrian safety and beautification project to install curb extensions at Washington Blvd at Patrick Henry Drive; curb extensions at 15th Street N, with double handicap-accessible ramps on the west side of Patrick Henry Drive to accommodate mid-block crossing; curb extensions at

16th Street N and N Lexington Street; bump-out entrance into parking area of Westover Apartments on west side of Patrick Henry Drive; install 5-foot bicycle lanes on the west side of Patrick Henry Drive from Washington Blvd to 16th Street N; install 5-foot sidewalk along several locations; install yellow painted dividing stripe on Patrick Henry Drive, and orient parking on the west side at the Westover Apartments to be 60 degree back-in parking. Travel lanes will be 10 feet on both sides of Patrick Henry Drive.

Although pedestrian comfort along this segment of Patrick Henry Drive will be improved, sidewalk widths still do not meet the minimum sidewalk widths in Arlington County for Primarily Single-Family Residential Neighborhoods Arterial.

N Illinois Street Improvements

Pedestrian safety and street improvement project on North Illinois Street from 22nd Street North to Lee Highway. The project scope includes: (1) design and installation of a new 5-foot continuous sidewalk, with a 2.5-foot utility strip adjacent, curb and gutter, on the west side of the street; (2) continuous curb and gutter on the east side of the street; (3) ADA compliant pedestrian ramps throughout the project area; and (4) curb extensions at the intersections of N Illinois Street with N 22nd Road, N 23rd Street, and N 24th Street.

24th Street Improvements

This is a neighborhood pedestrian safety and beautification project on 24th Street N, from N Illinois Street to N Kensington Street. The project scope includes: (1) installing a continuous 5-foot sidewalk, curb and gutter, and associated storm water infrastructure, on the south side of 24th Street N; (2) on-street parking being retained on both sides of 24th Street N; (3) ADA compliant pedestrian ramps being installed at the intersections with N Illinois and N Kensington Streets; and (4) New Carlyle style streetlights installed in the new 2.5-foot utility/buffer strip adjacent to the sidewalk.

East Falls Church Plan

The East Fall Church Plan includes street improvements such as new lane configurations, addition of on-street bicycle lanes, on-street parking (where possible), and intersection enhancements to increase pedestrian safety and reduce speeding and merging conflicts.

Some of the design features recommended for Washington Boulevard between the Reed site and the East Falls Church Metrorail station include: (1) removing exclusive right-turn

lanes and reducing vehicular travel lane widths to create space for on-street parking and a striped bicycle lane in each direction; and (2) providing tree/furniture zones and an 8-foot sidewalk.

Improving pedestrian connections in the vicinity of the East Falls Church Metrorail Station is seen as a vital strategy in increasing the likelihood of transit being used by commuters.

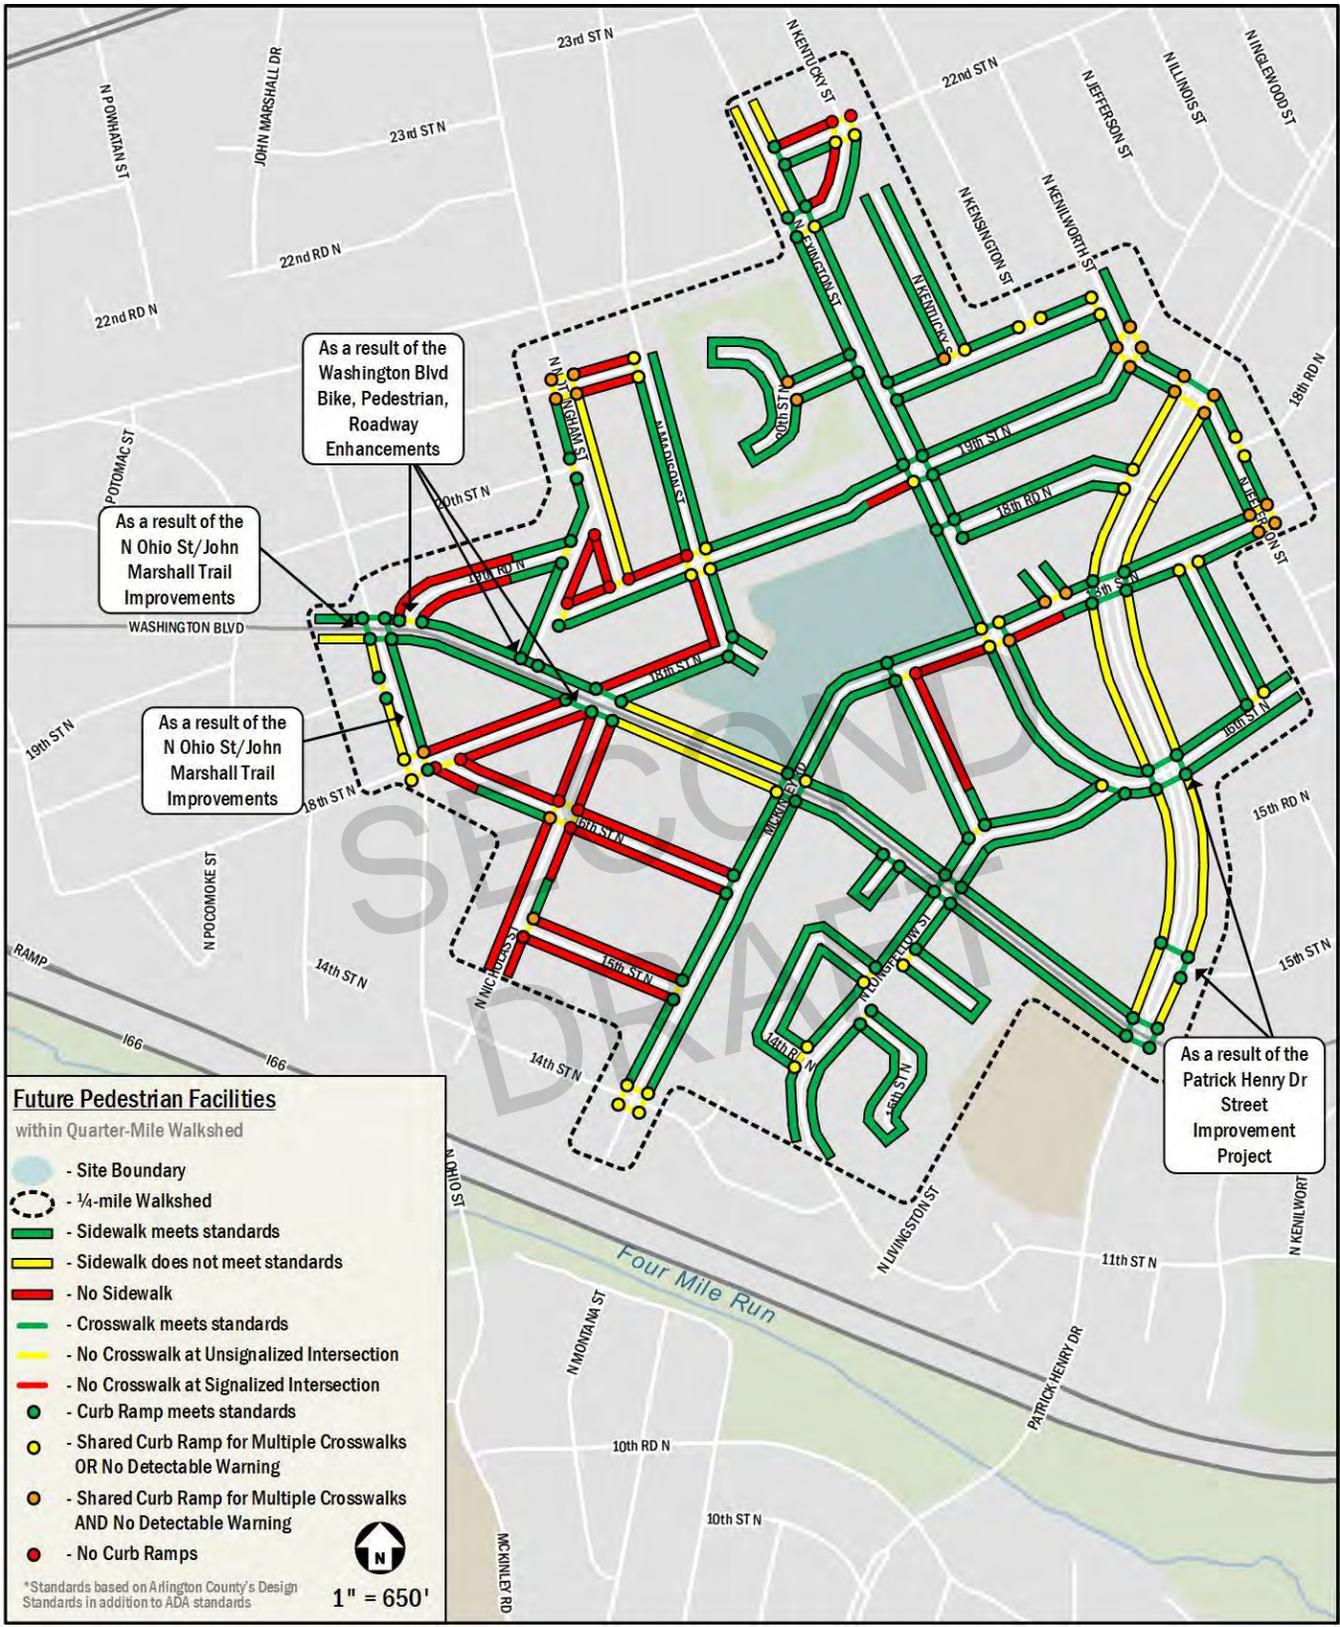

Figure 40: Future Pedestrian Facilities (quarter mile)

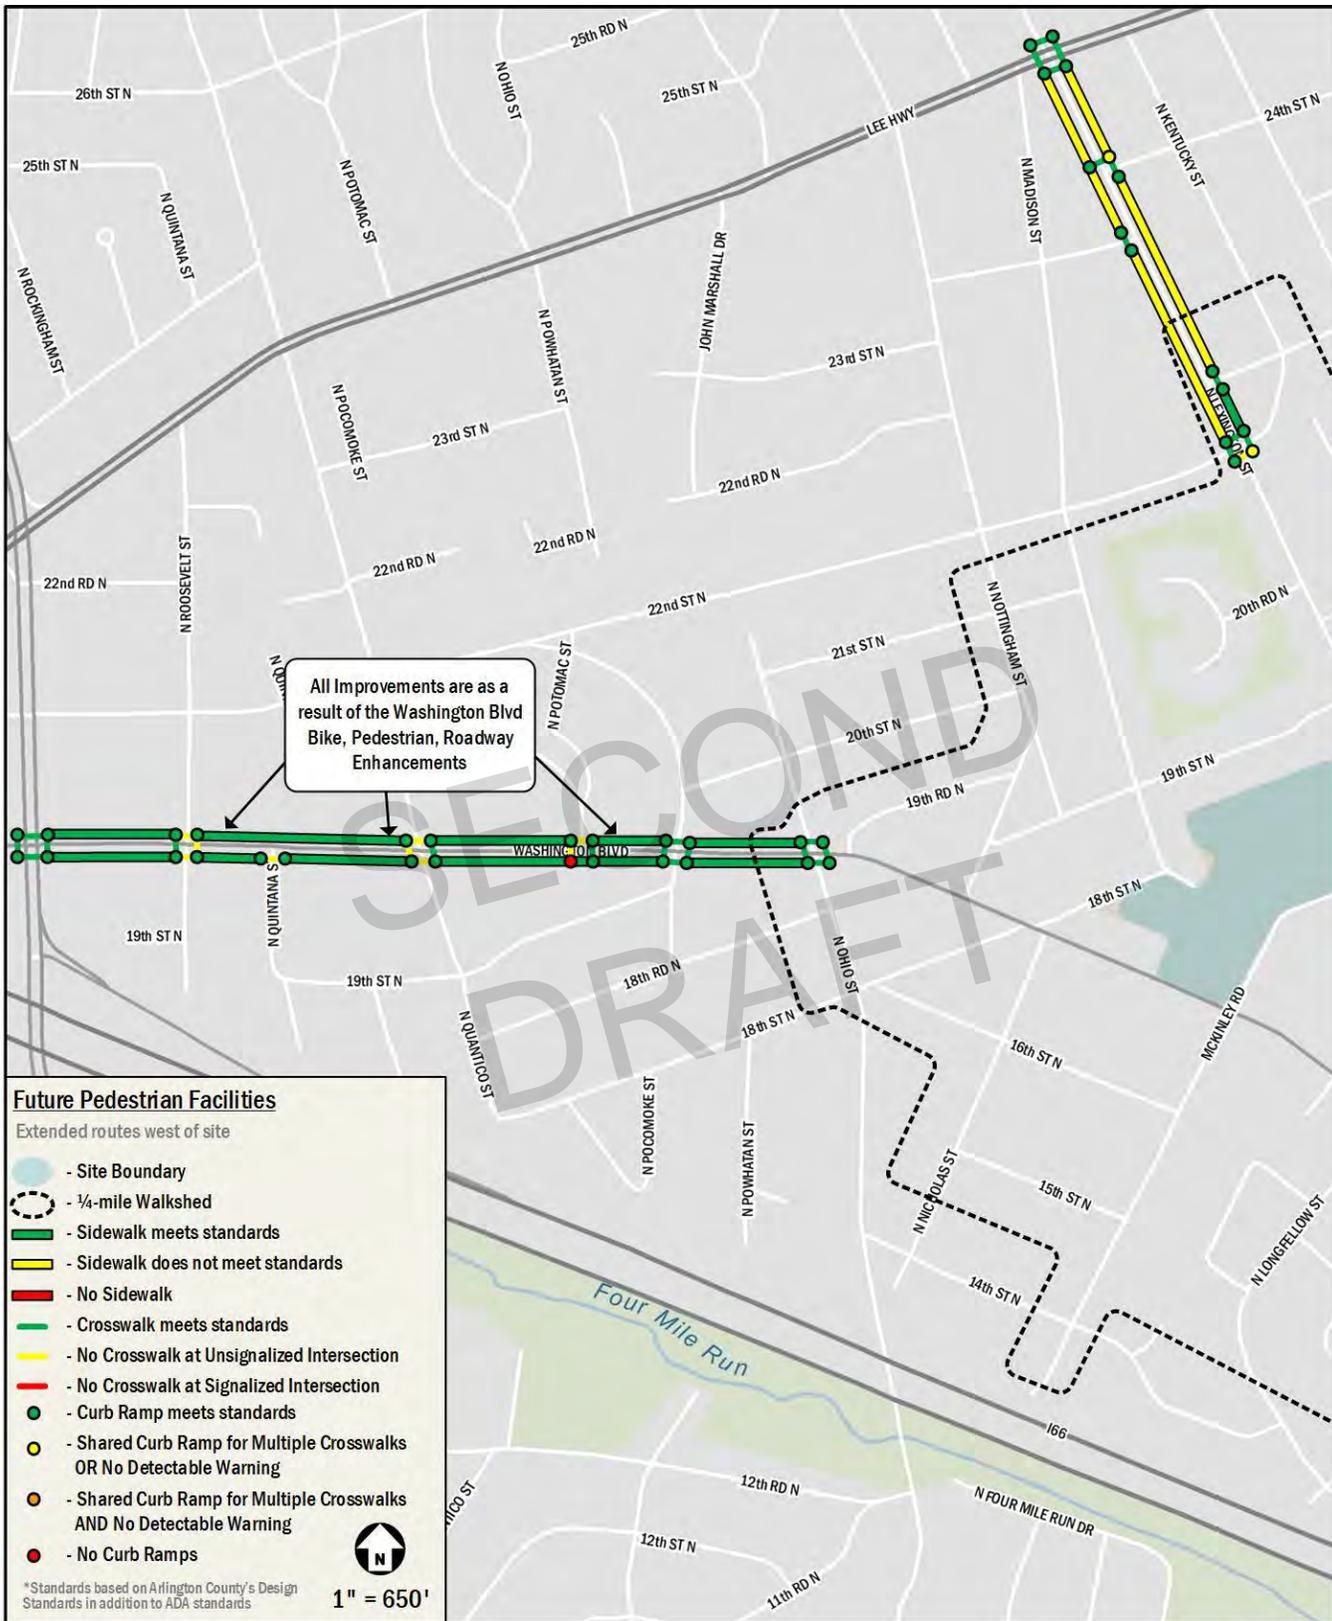

Figure 41: Future Pedestrian Facilities (routes to west)

PEDESTRIAN RECOMMENDATIONS

Based on the review of pedestrian facilities, this report concludes the following:

- Walking routes adjacent to the school generally meet County standards, with some exceptions to the south of the site in residential neighborhoods, and along sections of Washington Boulevard, Patrick Henry Drive, and 16th Street N
- Some targeted sidewalk improvements could help improve walking route quality, within the study area sidewalks can primarily be improved by adding sidewalks along expected walking routes that only have a sidewalk on one side of the street
- Specific improvements that the County could explore that would significantly improve the quality of the pedestrian walking area are adding sidewalks to (adding sidewalks to these areas would likely involve removal of on-street parking and as such would require further study by the County):
 - The southern side of 18th Street N between Patrick Henry Drive and Longfellow Street
 - The southern side of 16th Street N between George Mason Drive and N Jefferson Street.
- The presence of multiple signalized intersections along Washington Boulevard in the vicinity of the site provide safe crossing locations for pedestrians across an arterial. Each traffic signal provides adequate walk time for pedestrians crossing Washington Boulevard.
- Already planned infrastructure enhancements by the County on Washington Boulevard and Patrick Henry Drive will significantly improve pedestrian access to the site, especially at the intersection of Patrick Henry Drive and 16th Street N
- Even with the already planned improvements, some crossings over arterials could prove difficult for elementary school age students. This is due to factors such as the curvature and grade of Patrick Henry Drive making it difficult to upgrade the crosswalk quality even with enhanced signing and marking.
- This report recommends that the placement of crossing guards be considered at the following intersections when the school opens:
 - Washington Boulevard and 18th Street N
 - Patrick Henry Drive and 18th Street N
 - Patrick Henry Drive and 16th Street N
 - N Lexington Street and 18th Street N

BICYCLE FACILITIES

This section presents a review of bicycle routes to and from the Reed site. The purpose of this review is to develop a set of recommendations for infrastructure and operational improvements to raise the potential bicycle mode split of students and staff at the New ES. The steps performed in this review included:

- A detailed review of existing bicycle infrastructure in the vicinity of the site
- An examination of impacts that planned County projects would have on bicycle comfort levels to and from the site

The following conclusions are reached within this chapter:

- The site has good connectivity to existing on- and off-street bicycle facilities. The site is surrounded by local neighborhood streets, bicycle lanes on Washington Boulevard and Patrick Henry Drive, and the W&OD and Custis Trails and Metrorail at East Falls Church
- While there are no bicycle lanes on Washington Boulevard adjacent to the site and stretching westward, planned improvements will add bicycle lanes and narrow vehicular lanes in both direction, improving bicycle comfort levels.
- There is one (1) Capital Bikeshare station adjacent to the site, with an additional station planned at the intersection of Washington Boulevard and Patrick Henry Drive in FY2018
- Providing long-term bicycle parking, showers, and lockers for staff, and well situated short-term bicycle parking for students and visitors will increase the likelihood of people choosing to cycle to and from the site

EXISTING BICYCLE FACILITIES REVIEW

The site has good connectivity to existing on- and off-street bicycle facilities, and the site is surrounded by neighborhood streets that are relatively low in vehicular traffic and speed. North-south connectivity is provided via bicycle lanes on Patrick Henry Drive and signed routes on N Lexington Street and N McKinley Road. East-west connectivity is provided via bicycle lanes on Washington Boulevard and via signed routes on 22nd Street N.

In addition, the site is located a short distance from the W&OD and Custis Trails, which are both located less than 0.5 miles from the site. These two trails provide regional connectivity

bicycles to and from the site. Figure 42 shows existing bicycle facilities in the area.

Bicycle Parking

There is some short-term bicycle parking in the vicinity of the site, particularly near the entrance to the Westover Branch Library.

Capital Bikeshare

In addition to personal bicycle, the Capital Bikeshare program provides additional cycling options for staff and visitors of the planned development. The Bikeshare program has placed over 400 Bikeshare stations across Washington, DC, Arlington, and Alexandria, VA, Montgomery County, MD, and most recently Fairfax, VA, with over 3,700 bicycles provided. There is a Capital Bikeshare station that is adjacent to the site, on the northwest corner of the intersection of Washington Boulevard and N McKinley Road. The Capital Bikeshare stations house a total of 15 bikes. There is also a station about a mile down Washington Boulevard at the East Falls Church MetroRail station.

PLANNED BICYCLE FACILITIES

This section reviews planned infrastructure improvements near the Reed site that would improve bicycle comfort levels to and from the site.

Washington Boulevard Bike, Pedestrian, Roadway Enhancements

A number of improvements to bicycle infrastructure are included as part of the Washington Boulevard Bike, Pedestrian, Roadway Enhancements project. The most significant feature of the proposed plan is the introduction of bicycle lanes in both directions; some stretches getting an additional 2- or 3-foot buffer against moving traffic. In addition, the narrowing of unnecessarily wide travel lanes to help calm traffic will slow vehicles and further improve bicycle comfort levels.

The Washington Boulevard Bike, Pedestrian, Roadway Enhancements project was reviewed in more detail in the Study Area Overview chapter.

East Falls Church Plan

The East Fall Church Plan includes street improvements such as new lane configurations and the addition of on-street bicycle lanes. This is accomplished by removing exclusive right-turn lanes and reducing vehicular travel lane widths to create space

for on -street parking and a striped bicycle lane in each direction

Improving bicycle comfort in the vicinity of the East Falls Church Metrorail Station is seen as a vital strategy in increasing the likelihood of transit and bicycles being used by commuters.

Capital Bikeshare

One (1) Capital Bikeshare station is planned at the intersection of Washington Boulevard and Patrick Henry Drive, as part of Arlington County's Capital Bikeshare Expansion Plan. This station is scheduled to be installed in FY2018.

BICYCLE FACILITIES AT THE NEW ES

The plan for bicycle parking for the New ES is currently being developed as the project is in schematic design. The project plans to include short- and long-term bicycle parking.

Short-term bicycle parking spaces will be provided near the primary entrances of the school and will be designed to meet Arlington County's Bicycle Parking Guidelines (2016). This report recommends that bicycle parking be located on both the north and south sides of the New ES, as there will be bicycle facilities and/or bicycle friendly roads on both sides of the facility. In particular, some cyclists may use the trail that leads to 19th Street N.

The project also plans to include secure long-term bicycle parking, serving staff that commute to the school. The project plans to meet or exceed the number of long-term bicycle parking spaces, showers, and lockers as required by Arlington County. These long-term storage spaces are provided for staff so that they may store their bicycles securely.

The inclusion of short- and long-term bicycle parking and related facilities as a part of the project will increase the likelihood of students and staff commuting to and from the site by bicycle.

BICYCLE RECOMMENDATIONS

Based on the review of bicycle facilities, this report concludes the following:

- The site has good connectivity to existing on- and off-street bicycle facilities. The site is surrounded by local neighborhood streets, bicycle lanes on Washington

Boulevard and Patrick Henry Drive, and the W&OD and Custis Trails.

- While there are no bicycle lanes on Washington Boulevard adjacent to the site and stretching westward, planned improvements will add bicycle lanes and narrow vehicular lanes in both direction, improving bicycle comfort levels.
- There is one (1) Capital Bikeshare station adjacent to the site, with an additional station planned to be installed at the intersection of Washington Boulevard and Patrick Henry Drive in FY2018.
- The plans for on-site bicycle parking for the New ES are currently being developed as part of the schematic design. The school will meet or exceed County requirements for short and long-term bicycle parking on site and provide showers and lockers for staff that commute via bicycle.
- Based on the latest school design, the County requirements for bicycle parking are:
 - 37 short-term bicycle parking spaces
 - 15 long-term bicycle parking spaces
- This report recommends short-term bicycle parking be located on both the southern and northern entrances to the New ES, as cyclists will likely approach the school from several directions.

Figure 42:

TRANSPORTATION MANAGEMENT PLAN

A Transportation Management Plan (TMP) has many components that are tailored to accommodate a given facility with the goal being the reduction of automobile trips by encouraging alternative forms of transportation.

A few typical TMP components for elementary schools are the establishment of a Transportation Demand Management (TDM) plan, the establishment of a Safe Routes to School plan, the establishment of a Parking Management Plan, the establishment of Arrival and Dismissal Plans, and the establishment of a Performance and Monitoring Plan.

The TMP will include a schedule and details of implementation and continued operation of the elements in the plan. The TMP for the New ES at Reed may include, but not be limited to, the following:

TRANSPORTATION DEMAND MANAGEMENT

The TDM Plan addresses the use permit conditions and includes additional strategies for reducing single-occupancy vehicle (SOV) and single-family travel to the New ES at Reed consistent with the Arlington County TDM program and the APS Go! Master Plan.

The goals of the TDM plan are to:

1. Reduce staff drive rates from the existing rate in support of APS's division-wide goal of 75% by 2021 (as an average of all sites).
2. Increase the student walk/bike rate from the existing rate in support of APS's division-wide goal of 30% by 2021 (as an average of all schools).
3. Increase the number of school bus eligible students who ride the school bus.
4. Mitigate potential adverse impacts of parking on APS sites and in surrounding communities.
5. Support and grow a culture around walking, biking, carpooling and public transit use among students and staff.

A number of TDM strategies are outlined in the APS Go! Master Plan, which can be used to increase school bus utilization, public transit utilization, vanpool and carpool utilization, non-motorized transportation mode utilization – e.g., walking and biking, strategies for managing motor vehicle parking and student drop-off/pickup, and evaluation.

This report recommends focusing on the following TDM strategies:

General TDM Strategies

1. Appoint a School Transportation Coordinator (STC);
2. Promote the APS pre-tax transportation benefit;
3. Invite ATP and Safe Routes to School staff to Open House nights;

Strategies to Increase School Bus Utilization

4. Establish frequent bus rider incentive program;
5. Establish "walking school bus" program to bus stops;
6. Promote school bus use in communications with parents;

Strategies to Increase Public Transit Use

7. Make APS subsidized SmartTrip passes available to staff for trips to and from work;
8. Offer transit training for students;

Strategies to Increase Vanpool and Carpool Utilization

9. Inform staff members about the "Guaranteed Ride Home" program;
10. Provide monetary incentive for staff who participate in carpool or vanpools for travel to and from work;
11. Promote school pools to parents (i.e., carpools involving children from different families)

Strategies to Increase Non-Motorized Transportation Mode Utilization

12. Continue partnering with the County to make physical improvements to the pedestrian and bicycle environment near the school, as necessary
13. Provide secure bicycle parking/storage facilities for students and staff;
14. Provide shower/changing facilities on site for staff who bike or walk to work;
15. Maintain trained crossing guards at appropriate intersections near school;
16. Establish a walking club;
17. Establish and provide parents with information on walking school buses and bike trains;

Additional TDM strategies will be included in the final use permit. These TDM strategies will target specific community concerns regarding traffic, while complimenting the site's location and proximity to transit and bicycle facilities.

SAFE ROUTES TO SCHOOL

Safe Routes to School (SRTS) is a national program that works to make it safer and easier for students to walk or bike to school. SRTS programs examine conditions around schools and conduct projects and activities that work to improve safety and accessibility, and reduce traffic and air pollution in the vicinity of schools. The core elements of SRTS include:

- Enabling and encouraging children, including those with disabilities, to walk and bicycle to school
- Making bicycling and walking to school a safer and more appealing transportation alternative, thereby encouraging a healthy and active lifestyle from an early age.
- Facilitating the planning, development, and implementation of projects and activities that will improve safety and reduce traffic, fuel consumption, and air pollution near schools.

The Virginia SRTS Program offers several funding options through grants.

The following additional strategies can be used to compliment the TDM plan, and encourage and enable students to walk and bicycle to the New ES at Reed while fulfilling SRTS objectives:

1. Participate in Walk to School Day and Bike to School Day;
2. Consider establishing a regular (i.e. weekly or monthly) walk and bike to school day;
3. Create a Student Safety Patrol;
4. Hold pedestrian safety classes or assemblies;
5. Plan a Bicycle Rodeo; and
6. Create a frequent walker, biker, and bus rider program

PARKING MANAGEMENT PLAN

A Parking Management Plan (PMP) will address the use permit conditions and be consistent with Arlington Public Schools Policy 50-1.1.

The PMP will show how curbside space adjacent to the site will be designated for parking by the various users of the project. In addition, the PMP will provide effective directional signage to direct staff and visitors to appropriate location on the property.

ARRIVAL AND DISMISSAL PLANS

Arrival and dismissal plans will be developed for the New ES at the Reed site. Their purpose of these plans is to ensure that school arrival and dismissal occurs safely and efficiently for users of all modes.

These plans will include details on parent drop-off and pick-up procedures, including how the queuing space will be managed, where school staff will be placed and their roles, and the marketing/messaging for parents and students.

PERFORMANCE AND MONITORING

The New ES at Reed will maintain records of participation in APS non-SOV incentive programs and conduct biennial surveys of student, visitors, staff, and parents, regarding their travel to and from the school site. The School Transportation Coordinator (STC) will submit a biennial letter to APS Go! and the County Manager describing the results of the survey and any TDM related activities.

SECOND DRAFT

SUMMARY AND CONCLUSIONS

This report concludes that the New ES at the Reed site will not have a detrimental impact to the surrounding transportation and roadway network given the recommendations from this report are implemented, including the Transportation Management Plan.

Traffic Operations

The analyses contained within this report reached the conclusion that the surrounding streets can accommodate the anticipated traffic from the New ES, given certain design elements were incorporated into the schematic design and a Transportation Management Plan (TMP) is developed and implemented. This conclusion was based on the following findings from the technical analysis:

- The existing study area intersections all operate at acceptable levels of service and delay, with one exception. The southbound approach of 18th Street N to Washington Boulevard shows long delays as side street traffic waits for gaps in Washington Boulevard traffic. This condition is common for side streets with low traffic volume intersecting an arterial like Washington Boulevard.
- The future scenarios show similar results, with all study area intersections operating at acceptable levels with one exception.
- The vehicular trip generation from the New ES is relatively minor and does not change traffic patterns nearby in a detrimental way. This is especially true for during PM commuter park hour. The AM peak hour trip generation of 379 vehicles/hour is the equivalent of one new car on the road every 9.5 seconds. During the PM school peak hour, the vehicular trip generation of 310 vehicles/hour is the equivalent of one new car on the road every 11.5 seconds. During the PM commuter peak hour, the vehicular trip generation of 25 vehicles/hour is the equivalent of one new car on the road every 144 seconds.
- This report does not recommend any traffic mitigation measures for the proposed New ES (e.g. roadway widening or new traffic signals).

- A sensitivity analysis that explored different mode split scenarios for the New ES confirmed the findings of the baseline mode split scenario.
- These findings are based on trip generation and routing assumptions that are reliant on the certain elements being included in the New school's Transportation Management Plan (TMP). Thus, this report recommended development and implementation of the TMP be a commitment of approval.

Parking Impacts

Based on the overlap of parking demands with New ES, and in order to most efficiently use the parking provided on the Reed site while saving space for recreation fields, this report presents the following parking recommendations:

- Take advantage of the parking availability on surrounding neighborhood streets by using it as part of the parking supply for New ES staff.
- Based on a review of parking demand on residential streets adjacent to the Reed site, this report recommends that a maximum of 30 parked vehicles generated by the New ES should be parked off-site. Based on the parking demand calculations for the uses on site, this results in a minimum recommended parking supply on-site of 124 spaces. This report recommends that be the required minimum parking on site in lieu of the 150 spaces required by Zoning.
- Discourage New ES (and library) staff from parking in front of retail areas or the library, so that those spaces can be used by retail patrons and library visitors. Work with County staff on curbside management changes to on-street parking areas to deter staff parking in certain locations.
- Utilize the New ES's area set aside for arrival drop-off and dismissal pick-up queuing for visitor parking at other times. This additional visitor parking could be used by the library, notably to boost the supply during events such as story time that do not coincide with school arrival or dismissal.
- Sign the expanded Northwest and 18th Street parking lots in a manner that encourages sharing outside of school operating hours. Use signs such as "APS and

Library Staff parking only, Mon-Fri 6:00 AM to 4:30 PM, Public parking all other times”.

Pedestrian Facilities

The following conclusions are reached regarding pedestrian facilities:

- Walking routes adjacent to the school generally meet County standards, with some exceptions
- Some targeted sidewalk improvements could help improve walking route quality, within the study area sidewalks can primarily be improved by adding sidewalks along expected walking routes that only have a sidewalk on one side of the street
- The presence of multiple signalized intersections along Washington Boulevard in the vicinity of the site provide safe crossing locations for pedestrians across an arterial.
- Already planned infrastructure enhancements by the County on Washington Boulevard and Patrick Henry Drive will significantly improve pedestrian access to the site, especially at the intersection of Patrick Henry Drive and 16th Street N
- This report recommends that the placement of crossing guards be considered at the following intersections when the school opens:
 - Washington Boulevard and 18th Street N
 - Patrick Henry Drive and 18th Street N
 - Patrick Henry Drive and 16th Street N
 - N Lexington Street and 18th Street N

Bicycle Facilities

Based on a review of bicycle facilities, this report concludes the following:

- The site has good connectivity to existing on- and off-street bicycle facilities. The site is surrounded by local neighborhood streets, bicycle lanes on Washington Boulevard and Patrick Henry Drive, and the W&OD and Custis Trails.
- While there are no bicycle lanes on Washington Boulevard adjacent to the site and stretching westward, planned improvements will add bicycle lanes and narrow vehicular lanes in both direction, improving bicycle comfort levels.
- There is one (1) Capital Bikeshare station adjacent to the site, with an additional station planned to be

installed at the intersection of Washington Boulevard and Patrick Henry Drive in FY2018.

- The plans for on-site bicycle parking for the New ES are currently being developed as part of the schematic design. The school will meet or exceed County requirements for short and long-term bicycle parking on site and provide showers and lockers for staff that commute via bicycle.
- This report recommends covered short-term bicycle parking be located on both the southern and northern entrances to the New ES, as cyclists will likely approach the school from several directions.

Conclusion

This MMTA reached the conclusion that the development of the New ES on the Reed site will not have a detrimental impact to the surrounding roadway or parking systems, given certain design elements were incorporated into the schematic design and a Transportation Management Plan (TMP) is developed and implemented.

The required elements needed to be incorporated in schematic design include:

- A minimum of 124 off-street parking spaces on-site
- Room of seven school buses to load/unload
- An off-street student drop-off/pick-up area that can accommodate 30 total cars in queue
- Adequate bicycle parking for staff and students, with student parking located on multiple sides of the building

PRE-SCOPE OF WORK MEETING FORM

Information on the Project Traffic Impact Analysis Base Assumptions

The applicant is responsible for entering the relevant information and submitting the form to VDOT and the locality no less than three (3) business days prior to the meeting. If a form is not received by this deadline, the scope of work meeting may be postponed.

Contact Information

Developer/Owner Name: Ajibola (Aji) Robinson, Arlington Public Schools
 Tele: 703-228-7738
 E-mail: ajibola.robinson@apsva.us

Project Information

Project Name: New Elementary School at Reed Locality/County: Arlington County

Project Location: (Attach regional and site specific location map) The site is bordered by 18th Street N, N McKinley Road, and Washington Boulevard to the south, N Madison Street to the west, 19th Street N to the north, and N Lexington Street to the east. The site is located in the Westover neighborhood of Arlington, Virginia.

Submission Type Comp Plan Rezoning Site Plan Subd Plat

Project Description:
 (Including details on the land use, acreage, phasing, access location, etc. Attach additional sheet if necessary)

The following is a **revised** scoping form that provides more detail and revisions to assumptions already documented in the approved scoping form on file. Due to the timing of this project an opportunity exists to detail and refine some assumptions, based mainly on school survey data, existing traffic counts and Synchro models, and other information that has been analyzed since the scoping form was approved. Updated items within the form are highlighted in **red** below.

The primary changes are:

- The inclusion of the concept plan approved by the School Board
- A revised trip generation based not on ITE rates, but on APS Go! surveys
- Revised trip distributions, based on a review of potential APS planning units in the school boundary, patterns in existing traffic volumes, and the results of the existing conditions analysis (LOS and queuing)

This Multimodal Transportation Analysis (MMTA) will analyze a site currently improved with the existing Reed-Westover Building, which houses both Arlington County and Arlington County Public School (APS) Programs. The existing building is approximately 61,000 square feet, of which the Arlington County Westover Library Branch comprises of 16,000 square feet, and the APS Children's School and Integration Station are 45,000 square feet. The APS programs will be relocated prior to construction and it is expected that the library will continue operations throughout construction. The existing uses on the site are serviced by two surface parking lots comprising 72 parking spaces.

The proposed development will add an approximately 110,000 square foot elementary school to the site, with a student cap of 725 students. The facility will be a heavily used community asset. In addition to expected use during regular school hours it will be used to support the APS Extended Day program, used most evenings and weekends by community groups, and used throughout the summer for various camps and summer school/enrichment programs.

A conceptual design has been chosen and is shown in Figure 3. Vehicular access and the conceptual parking layout is also shown on Figure 3. The exact location of pedestrian access points and loading facilities for the proposed development are still being considered and will be included in the final report.

Based on trip generation calculations, a VDOT 870 study will not be needed.

NOTES on ASSUMPTIONS:

1. Synchro files/signal timings will be obtained from Arlington County.
2. The scenarios to be included in the study are Existing (2017), Future without Development (2021), Future with Development - Baseline (2021), Future with Development - Inclement Weather (2021), and Future with Development – Enhanced TDM (2021).
3. Existing peak hour factors in the range of 0.85 to 1.00 will be used for existing scenarios. The default peak hour factor of 0.92 to 1.00 will be used for all future scenarios.
4. Default heavy vehicle percentage of 2% will be used for all movements.
5. For any approach, LOS D or better would be considered as acceptable/desirable traffic operation condition. We will recommend mitigations if any intersection or approach experiences a degradation to LOS E or F in the future scenario where one does not exist in the background scenario
6. Signal timing adjustments would be considered as an acceptable mitigation measure.
7. Will provide both 95th and 50th percentile queues.
8. Will utilize HCM 2000 for signalized and unsignalized intersections.

It is important for the applicant to provide sufficient information to county and VDOT staff so that questions regarding geographic scope, alternate methodology, or other issues can be answered at the scoping meeting.

9. Level of service calculations for existing and future conditions without and with development shall be in accordance with the Highway Capacity Manual (HCM) 2000 methodologies, as computed by Synchro 9.1 software. Typical Synchro parameters to be utilized in this analysis will be consistent with those values provided in VDOT’s TOSAM and Arlington County standards.
10. A Multimodal Transportation Analysis (MMTA) will be provided in the study which will include the following information:
 - a. Multimodal trip generation
 - b. Curbside management information
 - c. Parking Demand in the vicinity of the site (as shown in Figure 8)
 - d. Transit Facilities
 - e. Transit Ridership (As available, to be provided by Arlington County)
 - f. Bike/pedestrian facilities (as shown in Figure 9, Figure 10, and Figure 11)
 - g. Multimodal Initiatives
 - h. Bus services within the study area
11. Data Collection:
 - a. We will collect weekday Turning Movement Counts (TMCs), including pedestrians and bicycles from 6:00AM-9:00AM and from 2:00PM-7:00PM at all study intersections. We will conduct counts on a “typical weekday” when Arlington Public Schools are in session and the Westover Library is open
12. Three mode split scenarios will be analyzed as part of this MMTA (shown in Table 4):
 - a. The baseline scenario
 - b. Inclement weather scenario (based on observations and APS Go! data)
 - c. Enhanced non-automobile use (TDM) scenario based on APS Go! data
13. Trip generation for the proposed development was developed using APS Go! data for APS locations with similar student, staff, and transportation profiles. Using this information, a daily vehicular trip generation was determined for each user group, and is attached to this form. By mapping daily trip generation, a morning peak hour, a school dismissal peak hour, and an evening peak hour was determined and is shown in Table 5.

*Enhanced TDM measures are not expected to affect visitor mode splits

Table 5: Peak Hour Vehicular Trip Generation Methodology (using Baseline Mode Splits) (New table)

Step 1

Existing trips (derived using turning movement counts at driveways of existing parking lots) to the site are removed from the network:

| Mode/User Group | Existing Trips | | | | | | | | |
|-----------------|----------------|----------------|----------------|---------------------|----------------|----------------|-----------------------|----------------|----------------|
| | AM Peak Hour | | | PM School Peak Hour | | | PM Commuter Peak Hour | | |
| | IB | OB | Total | IB | OB | Total | IB | OB | Total |
| Auto Library | 1 v/hr | 1 v/hr | 2 v/hr | 11 v/hr | 15 v/hr | 26 v/hr | 3 v/hr | 6 v/hr | 9 v/hr |
| Auto Day Care | 50 v/hr | 34 v/hr | 84 v/hr | 26 v/hr | 33 v/hr | 59 v/hr | 16 v/hr | 43 v/hr | 59 v/hr |
| Total | 51 v/hr | 35 v/hr | 86 v/hr | 37 v/hr | 48 v/hr | 85 v/hr | 19 v/hr | 49 v/hr | 68 v/hr |

Step 2

Trips belonging to the existing library use on site are added to the network

(library trips being removed and reapplied to the network because they will be parking in different locations):

| Mode/User Group | Existing Library Trips | | | | | | | | |
|-----------------|------------------------|--------|--------|---------------------|---------|---------|-----------------------|--------|--------|
| | AM Peak Hour | | | PM School Peak Hour | | | PM Commuter Peak Hour | | |
| | IB | OB | Total | IB | OB | Total | IB | OB | Total |
| Auto Library | 1 v/hr | 1 v/hr | 2 v/hr | 11 v/hr | 15 v/hr | 26 v/hr | 3 v/hr | 6 v/hr | 9 v/hr |

Step 3

New site-generated trips added to the network:

| Mode/User Group | Elementary School at Reed Trip Generation | | | | | | | | |
|-----------------|---|-----------------|-----------------|---------------------|-----------------|-----------------|-----------------------|----------------|-----------------|
| | AM Peak Hour | | | PM School Peak Hour | | | PM Commuter Peak Hour | | |
| | IB | OB | Total | IB | OB | Total | IB | OB | Total |
| Auto Students | 200 v/hr | 200 v/hr | 400 v/hr | 145 v/hr | 145 v/hr | 290 v/hr | 50 v/hr | 44 v/hr | 94 v/hr |
| Auto Staff | 58 v/hr | 1 v/hr | 59 v/hr | 0 v/hr | 49 v/hr | 49 v/hr | 0 v/hr | 21 v/hr | 21 v/hr |

VEHICLE PEAK HOUR VOLS AND PHF: System Peak (vehicle)

HEAVY VEH PEAK HOUR VOLS AND PHV: System Peak (vehicle)

PED AND BIKE PEAK HOUR VOLUMES: System Peak (vehicle)

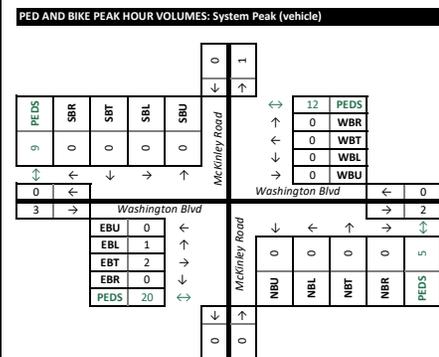

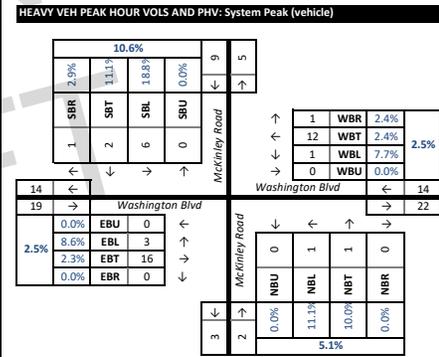

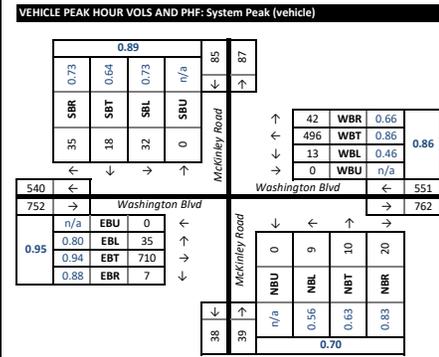

DATA COLLECTION NOTES:

Gorove/Slade Associates - Multimodal Turning Movement Count Report

Project Name : New Reed ES Analysis Period: STUDY PERIOD 06:00 AM to 09:00 AM
 Project # : 2769-001 Date of Counts: Thursday, February 1, 2018
 Location Arlington VA Weather: Cloudy
 Data Source: Gorove/Slade Associates, Inc.

Volumes Displayed as: 2. System Peak (vehicle)
 Intersection Peak Hour (all vehicles): 08:00 AM to 09:00 AM
 System Peak Hour (all vehicles): 07:30 AM to 08:30 AM
 User-Defined Peak Hour: 07:00 AM to 08:00 AM

VEHICLE PEAK HOUR VOLS AND PHF: System Peak (vehicle)

HEAVY VEH PEAK HOUR VOLS AND PHV: System Peak (vehicle)

PED AND BIKE PEAK HOUR VOLUMES: System Peak (vehicle)

DATA COLLECTION NOTES :

Gorove/Slade Associates - Multimodal Turning Movement Count Report

Project Name : New Reed ES
 Project # : 2769-001
 Location : Arlington VA
 Data Source : Gorove/Slade Associates, Inc.

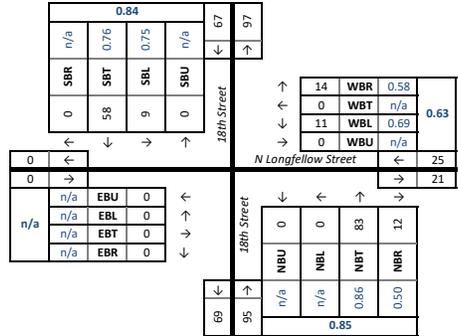

Analysis Period: STUDY PERIOD
 Date of Counts: Thursday, February 1, 2018
 Weather: Cloudy

06:00 AM to 09:00 AM

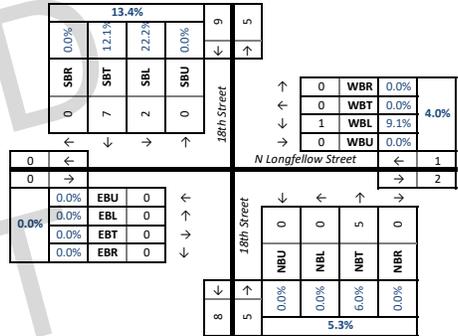

Volumes Displayed as: 2. System Peak (vehicle)
 Intersection Peak Hour (all vehicles): 07:15 AM to 08:15 AM
 System Peak Hour (all vehicles): 07:30 AM to 08:30 AM
 User-Defined Peak Hour: 07:00 AM to 08:00 AM

DATA COLLECTION NOTES :

Gorove/Slade Associates - Multimodal Turning Movement Count Report

Project Name : New Reed ES
 Project # : 2769-001
 Location : Arlington VA
 Data Source : Gorove/Slade Associates, Inc.

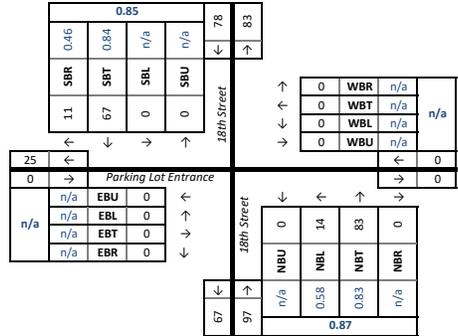

Analysis Period: STUDY PERIOD
 Date of Counts: Thursday, February 1, 2018
 Weather: Cloudy

06:00 AM to 09:00 AM

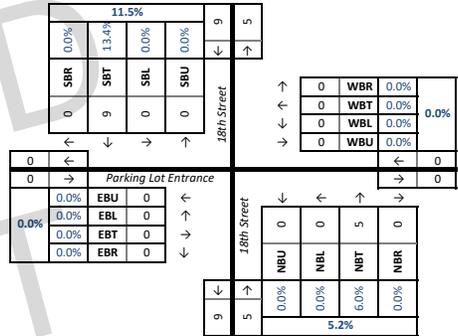

Volumes Displayed as: 2. System Peak (vehicle)
 Intersection Peak Hour (all vehicles): 07:30 AM to 08:30 AM
 System Peak Hour (all vehicles): 07:30 AM to 08:30 AM
 User-Defined Peak Hour: 07:00 AM to 08:00 AM

PED AND BIKE PEAK HOUR VOLUMES: System Peak (vehicle)

DATA COLLECTION NOTES :

Gorove/Slade Associates - Multimodal Turning Movement Count Report

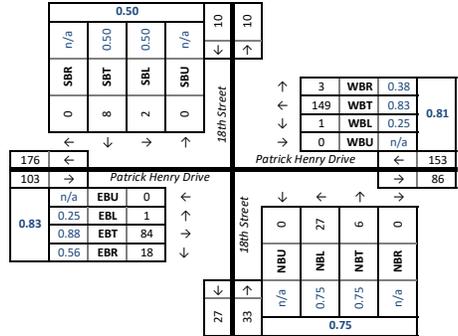

Project Name : New Reed ES
 Project # : 2769-001
 Location : Arlington VA
 Data Source : Gorove/Slade Associates, Inc.

Analysis Period: STUDY PERIOD
 Date of Counts: Thursday, February 1, 2018
 Weather: Cloudy

Volumes Displayed as: 2. System Peak (vehicle)
 Intersection Peak Hour (all vehicles): 07:30 AM to 08:30 AM
 System Peak Hour (all vehicles): 07:30 AM to 08:30 AM
 User-Defined Peak Hour: 07:00 AM to 08:00 AM

DATA COLLECTION NOTES :

Gorove/Slade Associates - Multimodal Turning Movement Count Report

Project Name : New Reed ES Analysis Period : STUDY PERIOD 06:00 AM to 09:00 AM
 Project # : 2769-001 Date of Counts : Thursday, February 1, 2018
 Location : Arlington VA Weather : Cloudy
 Data Source : Gorove/Slade Associates, Inc.

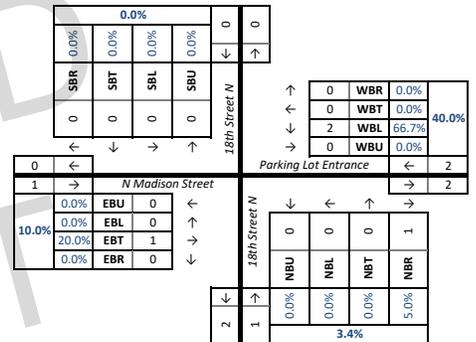

Volumes Displayed as: 2. System Peak (vehicle)
 Intersection Peak Hour (all vehicles): 07:45 AM to 08:45 AM
 System Peak Hour (all vehicles): 07:30 AM to 08:30 AM
 User-Defined Peak Hour: 07:00 AM to 08:00 AM

HEAVY VEH PEAK HOUR VOLS AND PHF: System Peak (vehicle)

PED AND BIKE PEAK HOUR VOLUMES: System Peak (vehicle)

DATA COLLECTION NOTES:

Gorove/Slade Associates - Multimodal Turning Movement Count Report

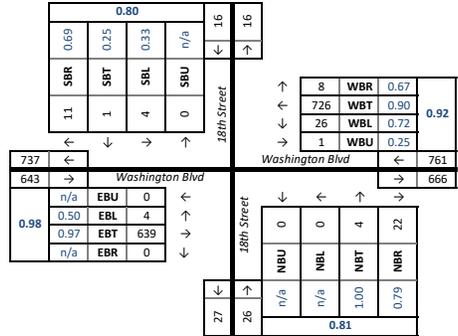

Project Name : New Reed ES
 Project # : 2769-001
 Location : Arlington VA
 Data Source : Gorove/Slade Associates, Inc.

Analysis Period: STUDY PERIOD
 Date of Counts: Thursday, February 1, 2018
 Weather: Cloudy
 02:00 PM to 07:00 PM

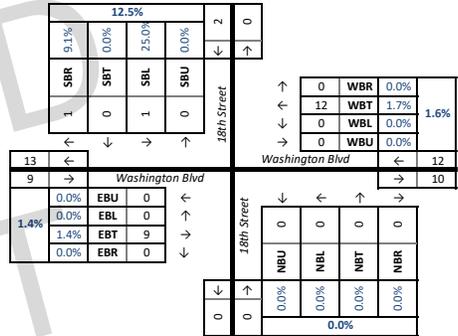

Volumes Displayed as: 2. System Peak (vehicle)
 Intersection Peak Hour (all vehicles): 04:45 PM to 05:45 PM
 System Peak Hour (all vehicles): 04:45 PM to 05:45 PM
 User-Defined Peak Hour: 03:00 PM to 04:00 PM

Gorove/Slade Associates - Multimodal Turning Movement Count Report

Project Name : New Reed ES
 Project # : 2769-001
 Location : Arlington VA
 Data Source : Gorove/Slade Associates, Inc.

Analysis Period: STUDY PERIOD
 Date of Counts: Thursday, February 1, 2018
 Weather: Cloudy

02:00 PM to 07:00 PM

Volumes Displayed as: 2. System Peak (vehicle)
 Intersection Peak Hour (all vehicles): 04:15 PM to 05:15 PM
 System Peak Hour (all vehicles): 04:45 PM to 05:45 PM
 User-Defined Peak Hour: 03:00 PM to 04:00 PM

| Intersection: 1. 18th Street & /Parking Lot Exit | | Southbound | | | | | Westbound | | | | | Northbound | | | | | Eastbound | | | | | |

Gorove/Slade Associates - Multimodal Turning Movement Count Report

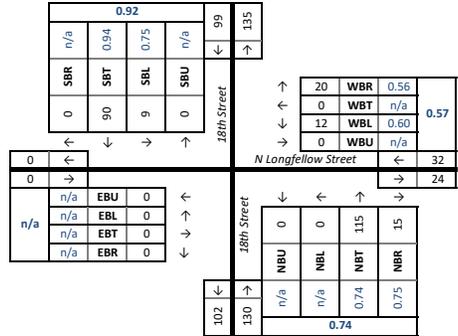

Project Name : New Reed ES
 Project # : 2769-001
 Location : Arlington VA
 Data Source : Gorove/Slade Associates, Inc.

Analysis Period: STUDY PERIOD
 Date of Counts: Thursday, February 1, 2018
 Weather: Cloudy
 02:00 PM to 07:00 PM

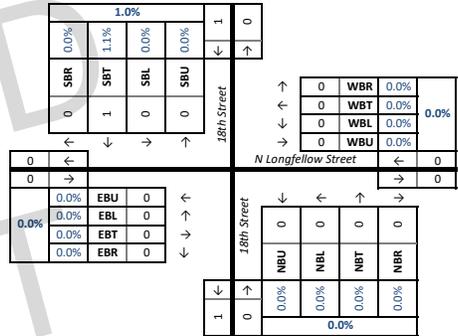

Volumes Displayed as: 2. System Peak (vehicle)
 Intersection Peak Hour (all vehicles): 04:15 PM to 05:15 PM
 System Peak Hour (all vehicles): 04:45 PM to 05:45 PM
 User-Defined Peak Hour: 03:00 PM to 04:00 PM

Gorove/Slade Associates - Multimodal Turning Movement Count Report

Project Name : New Reed ES
 Project # : 2769-001
 Location : Arlington VA
 Data Source : Gorove/Slade Associates, Inc.

Analysis Period: STUDY PERIOD 02:00 PM to 07:00 PM
 Date of Counts: Thursday, February 1, 2018
 Weather: Cloudy

Volumes Displayed as: 2. System Peak (vehicle)
 Intersection Peak Hour (all vehicles): 04:30 PM to 05:30 PM
 System Peak Hour (all vehicles): 04:45 PM to 05:45 PM
 User-Defined Peak Hour: 03:00 PM to 04:00 PM

VEHICLE PEAK HOUR VOLS AND PHF: System Peak (vehicle)

HEAVY VEH PEAK HOUR VOLS AND PHV: System Peak (vehicle)

Gorove/Slade Associates - Multimodal Turning Movement Count Report

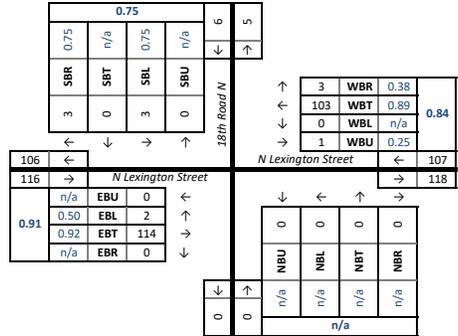

Project Name : New Reed ES
 Project # : 2769-001
 Location : Arlington VA
 Data Source : Gorove/Slade Associates, Inc.

Analysis Period: STUDY PERIOD
 Date of Counts: Thursday, February 1, 2018
 Weather: Cloudy
 02:00 PM to 07:00 PM

Volumes Displayed as: 2. System Peak (vehicle)
 Intersection Peak Hour (all vehicles): 05:30 PM to 06:30 PM
 System Peak Hour (all vehicles): 04:45 PM to 05:45 PM
 User-Defined Peak Hour: 03:00 PM to 04:00 PM

| Intersection: 1. 18th Road N/ & N Lexington Street | | Southbound | | | | | Westbound | | | | | Northbound | | | | | Eastbound | | | | |

PED AND BIKE PEAK HOUR VOLUMES: System Peak (vehicle)

DATA COLLECTION NOTES :

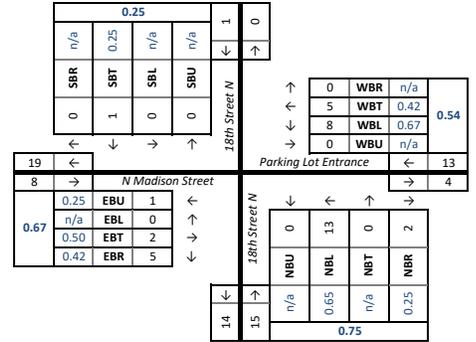

Gorove/Slade Associates - Multimodal Turning Movement Count Report

Project Name : New Reed ES Analysis Period : STUDY PERIOD 02:00 PM to 07:00 PM
 Project # : 2769-001 Date of Counts : Thursday, February 1, 2018
 Location : Arlington VA Weather : Cloudy
 Data Source : Gorove/Slade Associates, Inc.

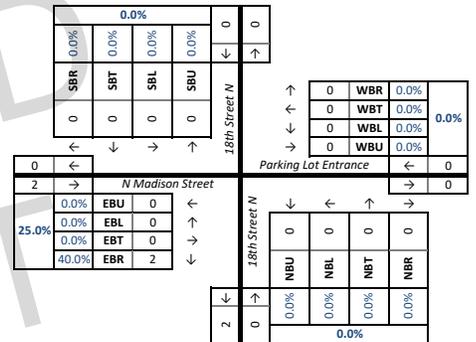

Volumes Displayed as: 2. System Peak (vehicle)
 Intersection Peak Hour (all vehicles): 03:45 PM to 04:45 PM
 System Peak Hour (all vehicles): 04:45 PM to 05:45 PM
 User-Defined Peak Hour: 03:00 PM to 04:00 PM
